

Canada–France Imaging Survey

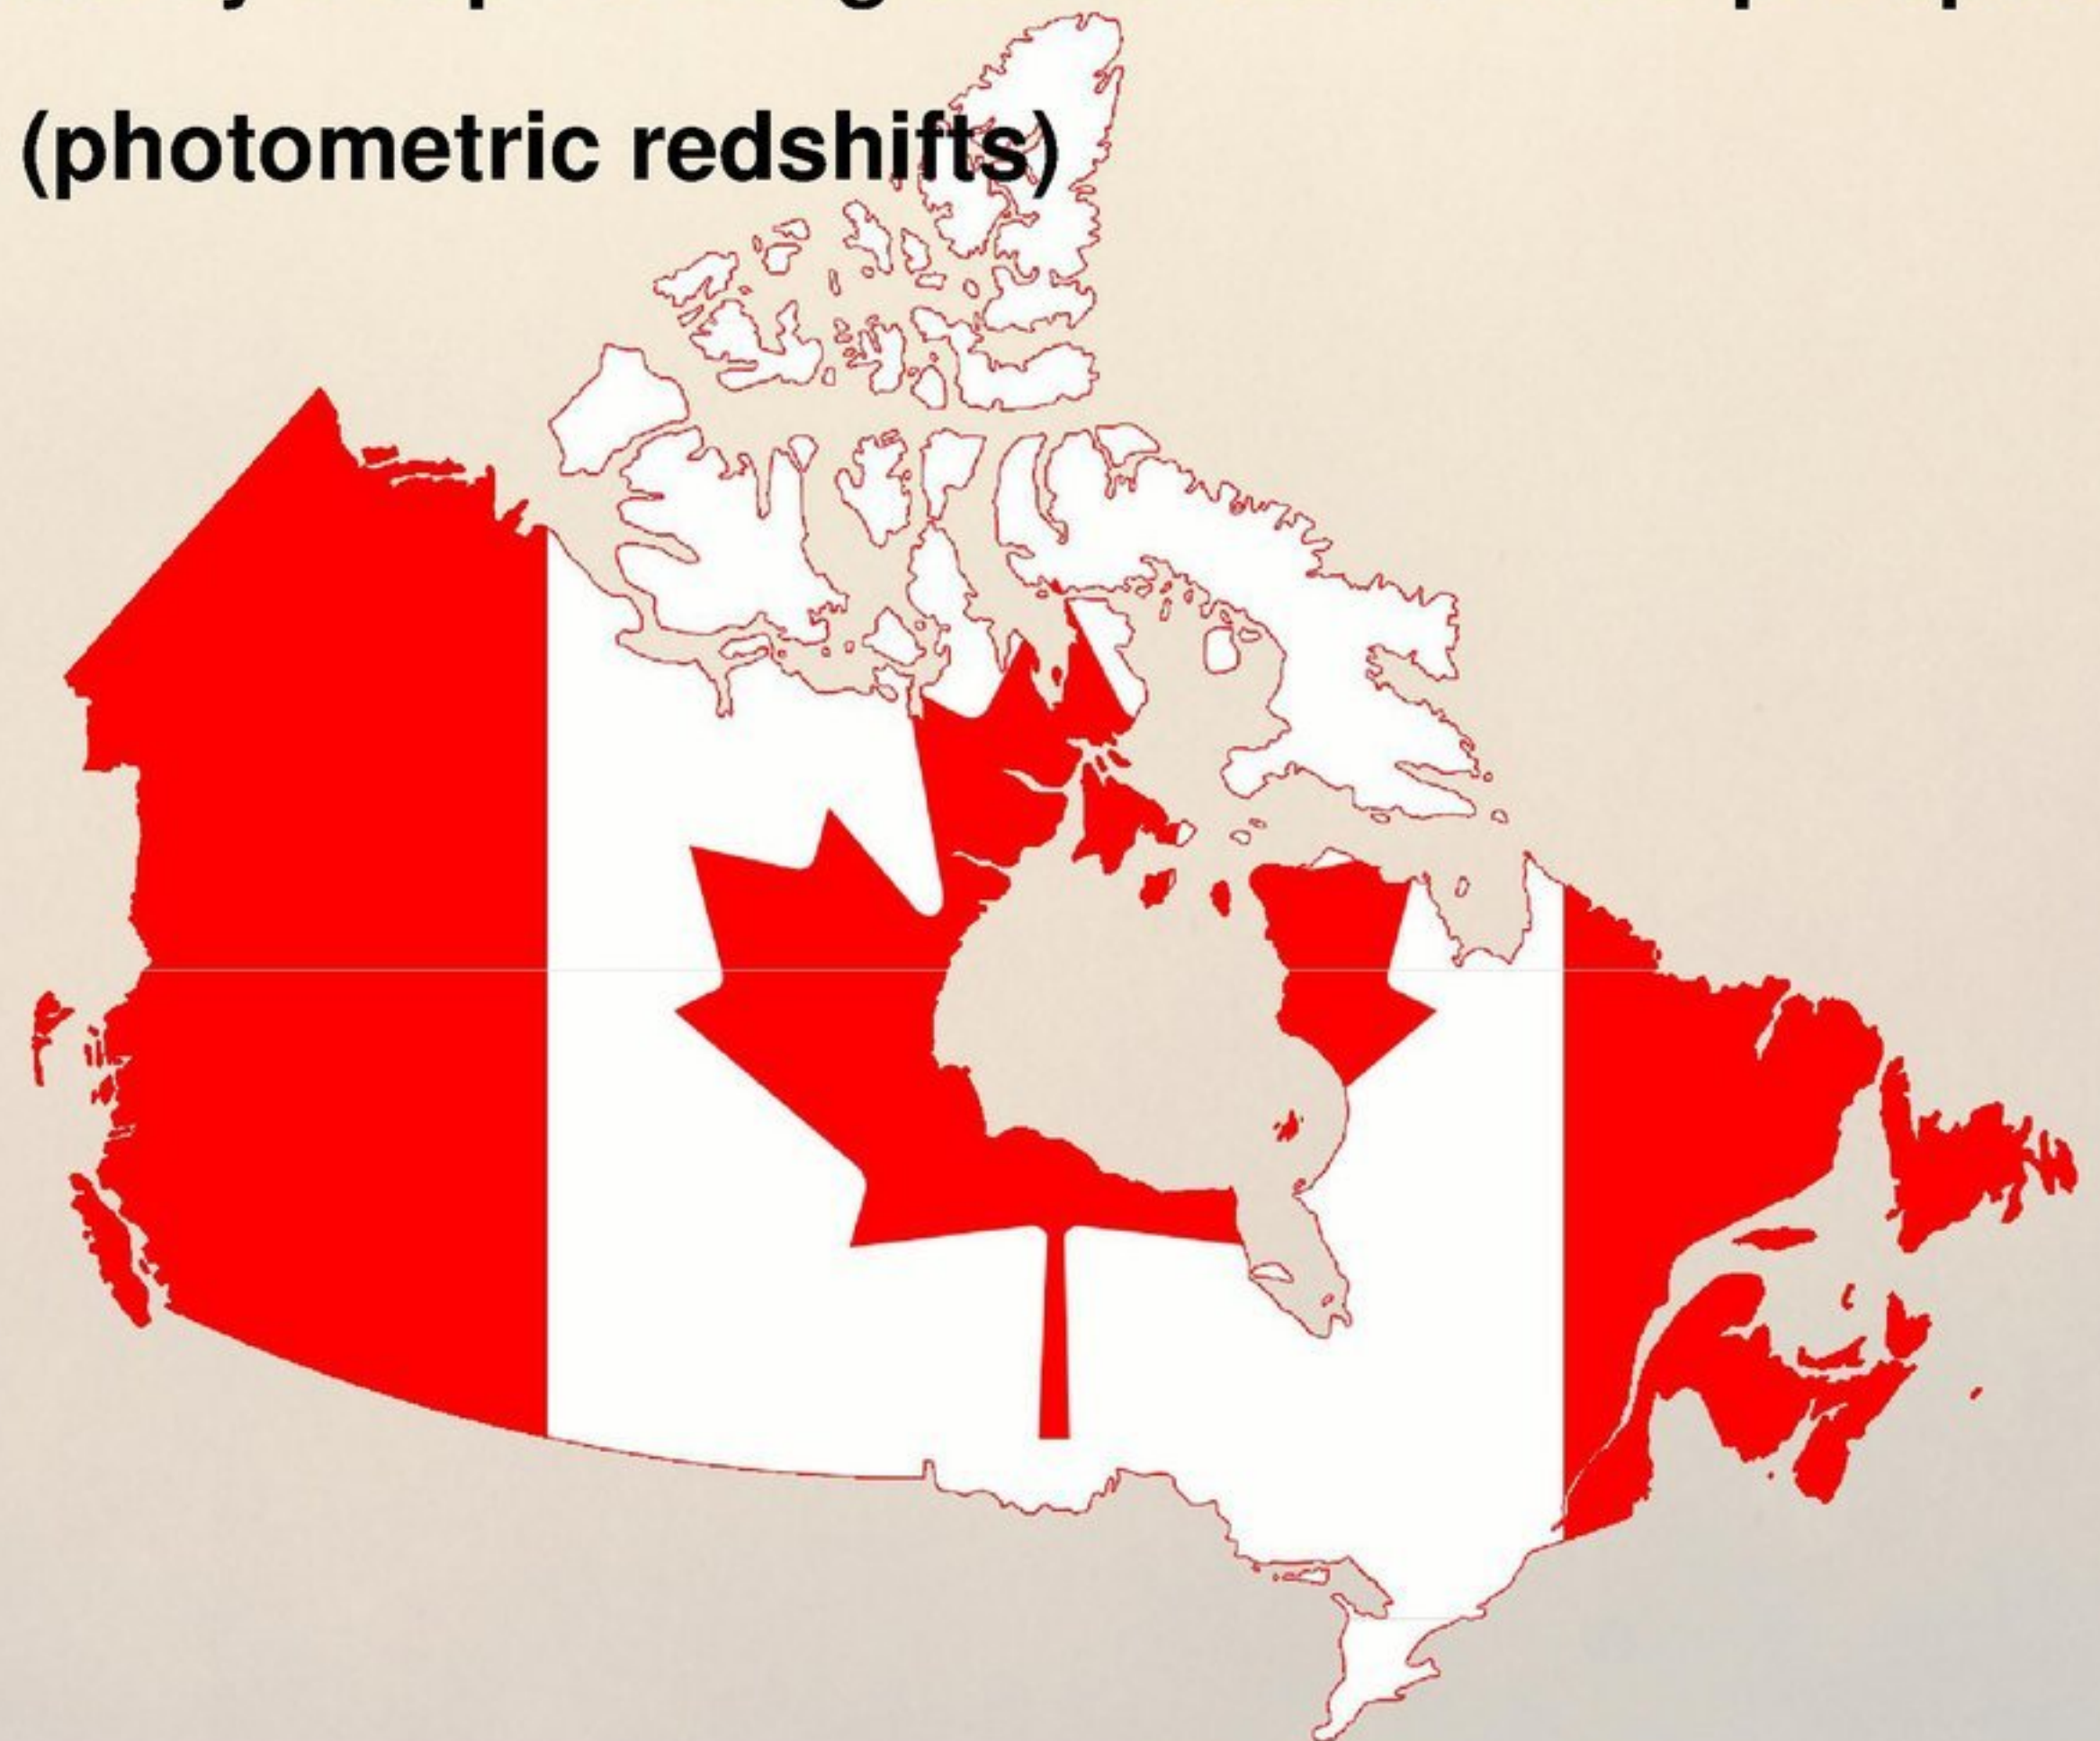

Observing Status

Jean–Charles Cuillandre *CEA Saclay/Obs. de Paris*
on behalf of the UNIONS CFIS/Pan–STARRS collaboration

The Canada–France Imaging Survey in a nutshell

- **UNIONS CFIS/Pan–STARRS : 140 scientists ~ 80 France + 40 Canada + 10 Hawaii + 10 International**
- **CFIS : 271 CFHT–MegaCam nights allocated from Feb. 2017 to Jul. 2021**
- **A survey serving science from the solar system, the galaxy, nearby universe, and cosmology**
- **An "all–sky" type survey built on CFHT's greatest strengths (u–band, r–band image quality, FOV)**
- **A legacy dataset open to all interested scientists in Canada and France**
- **A collaboration welcoming all interested scientists in France and Canada (pending a few rules)**
- **A complete logistic support from CADC/CANFAR for data calibration, hosting, and distribution**
- **The result in France of a large consultation followed by a top ranking at the latest INSU prospective**
- **A critical component of the Euclid space mission (photometric redshifts)**

The best wide-field imaging ever on the CFHT

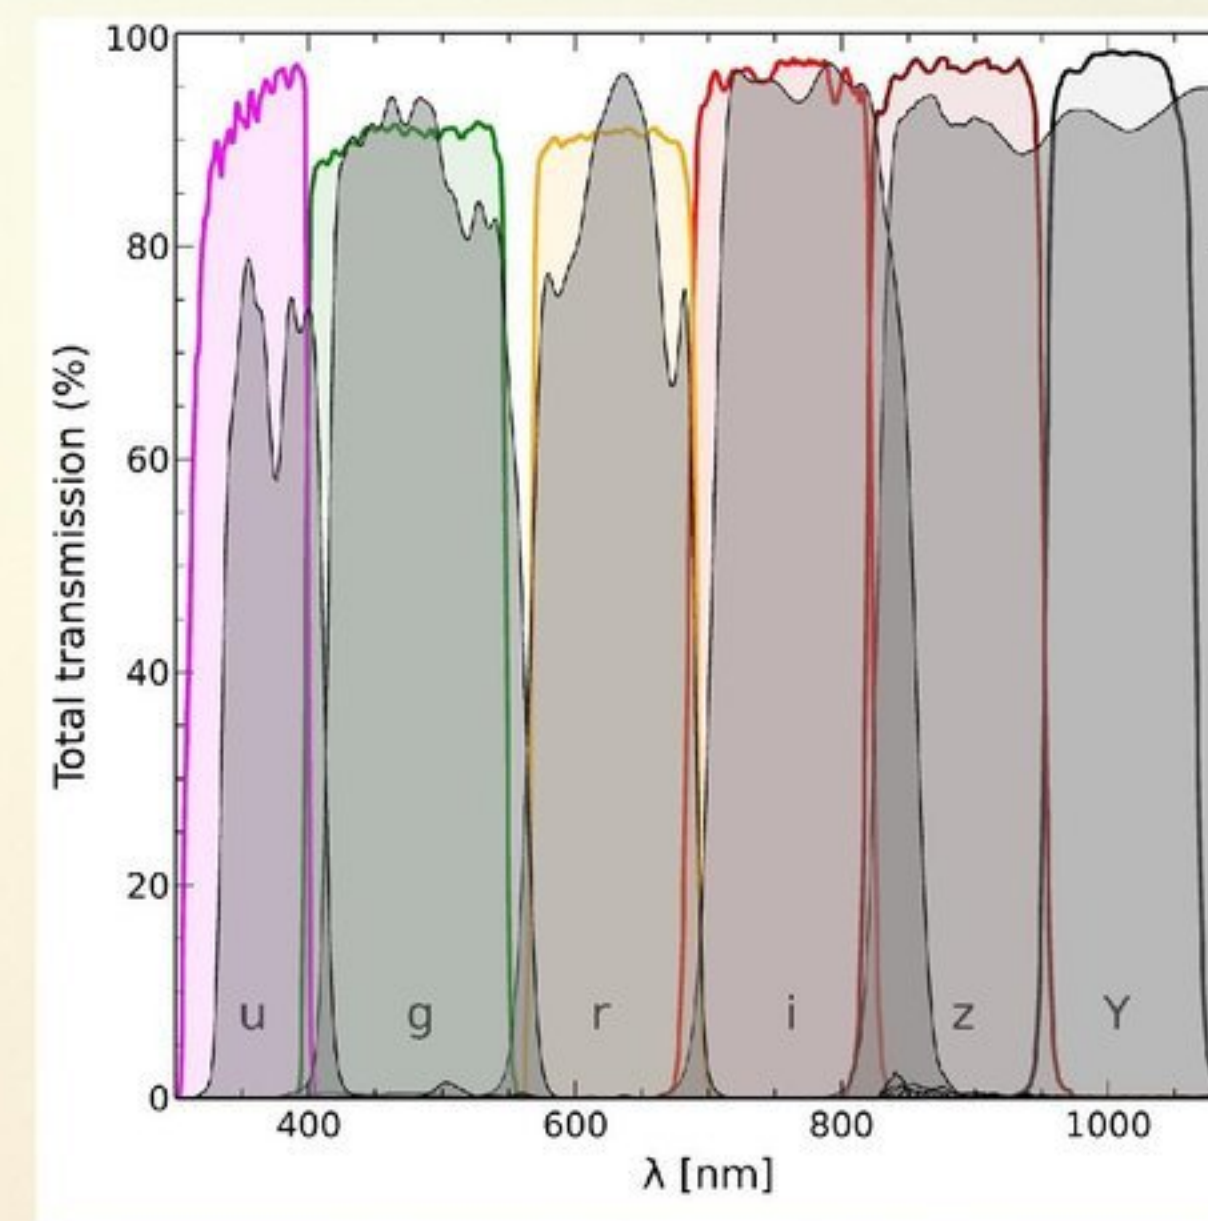

Telescope & instrumental improvements (2011–2014):

Dome venting

40 CCDs + Fast readout

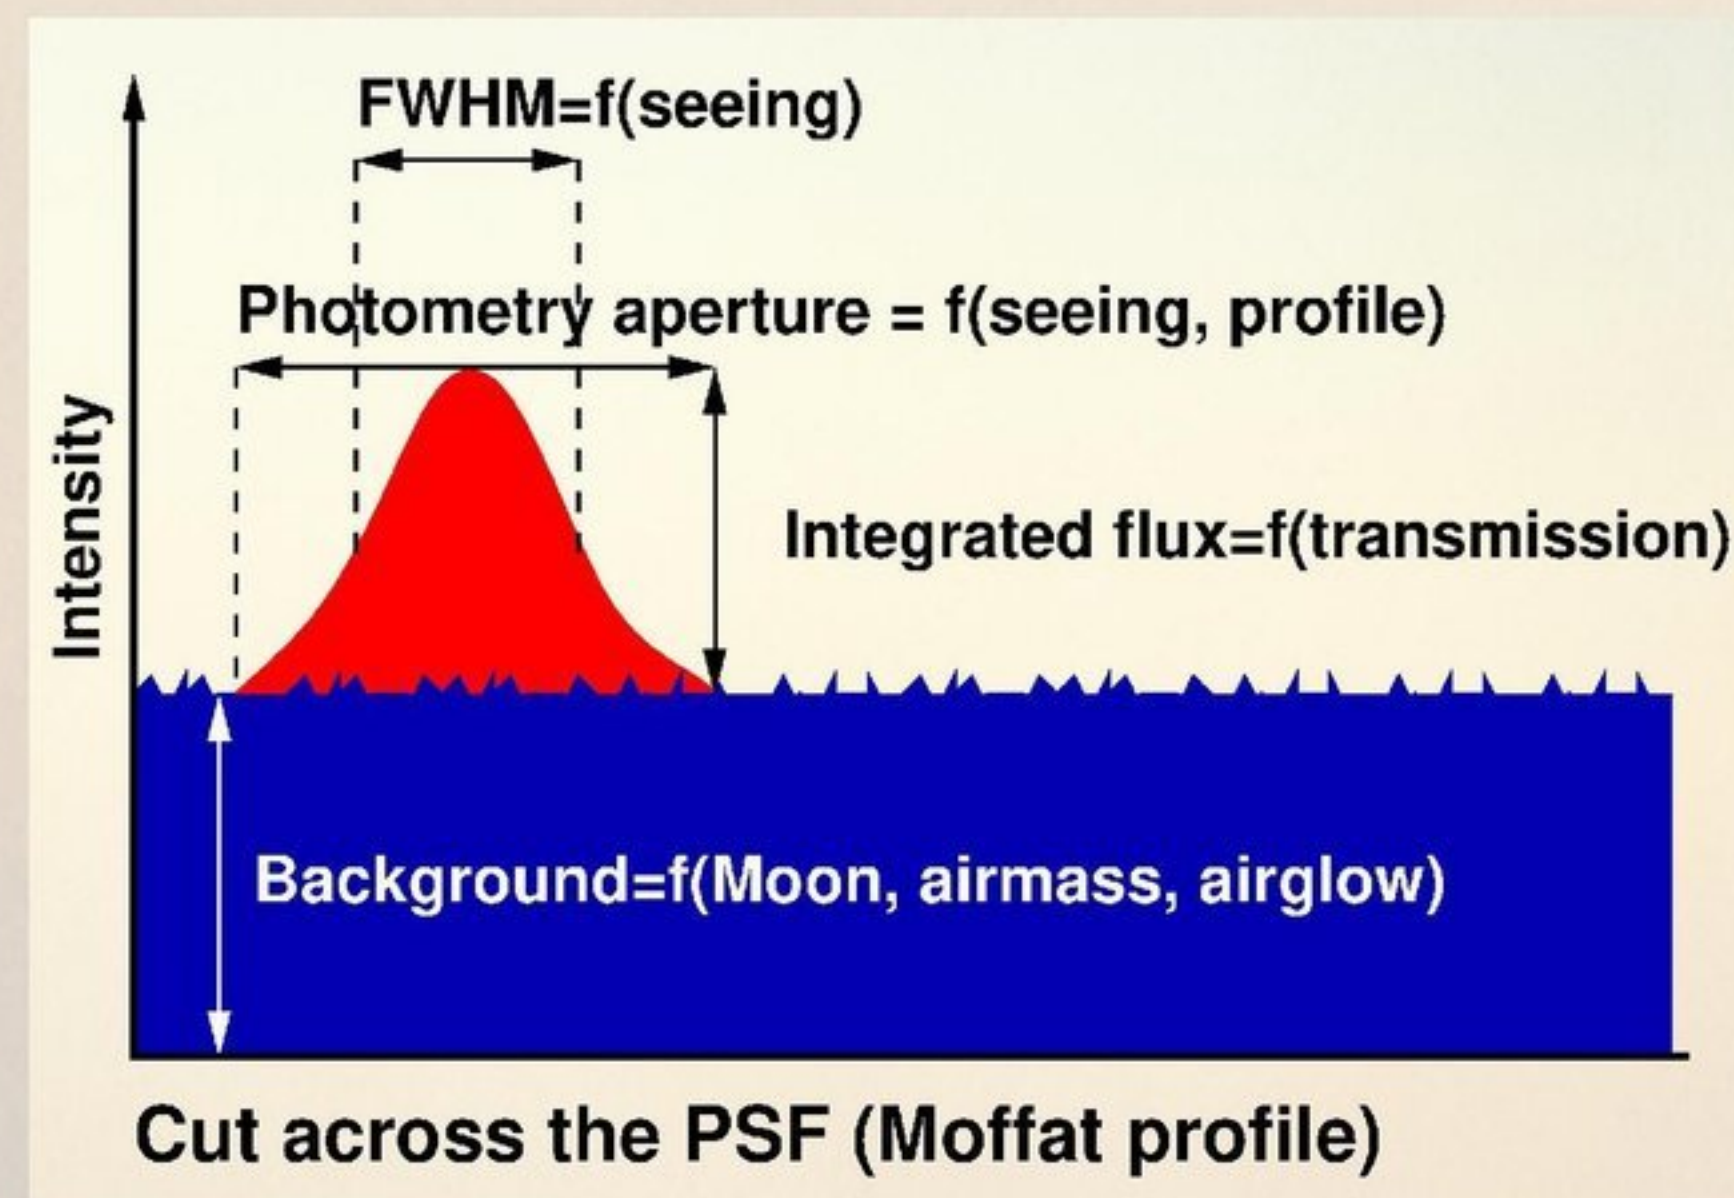

New "square" filters

Data acquisition & processing optimization (2008–2016):

Low Surface Brightness

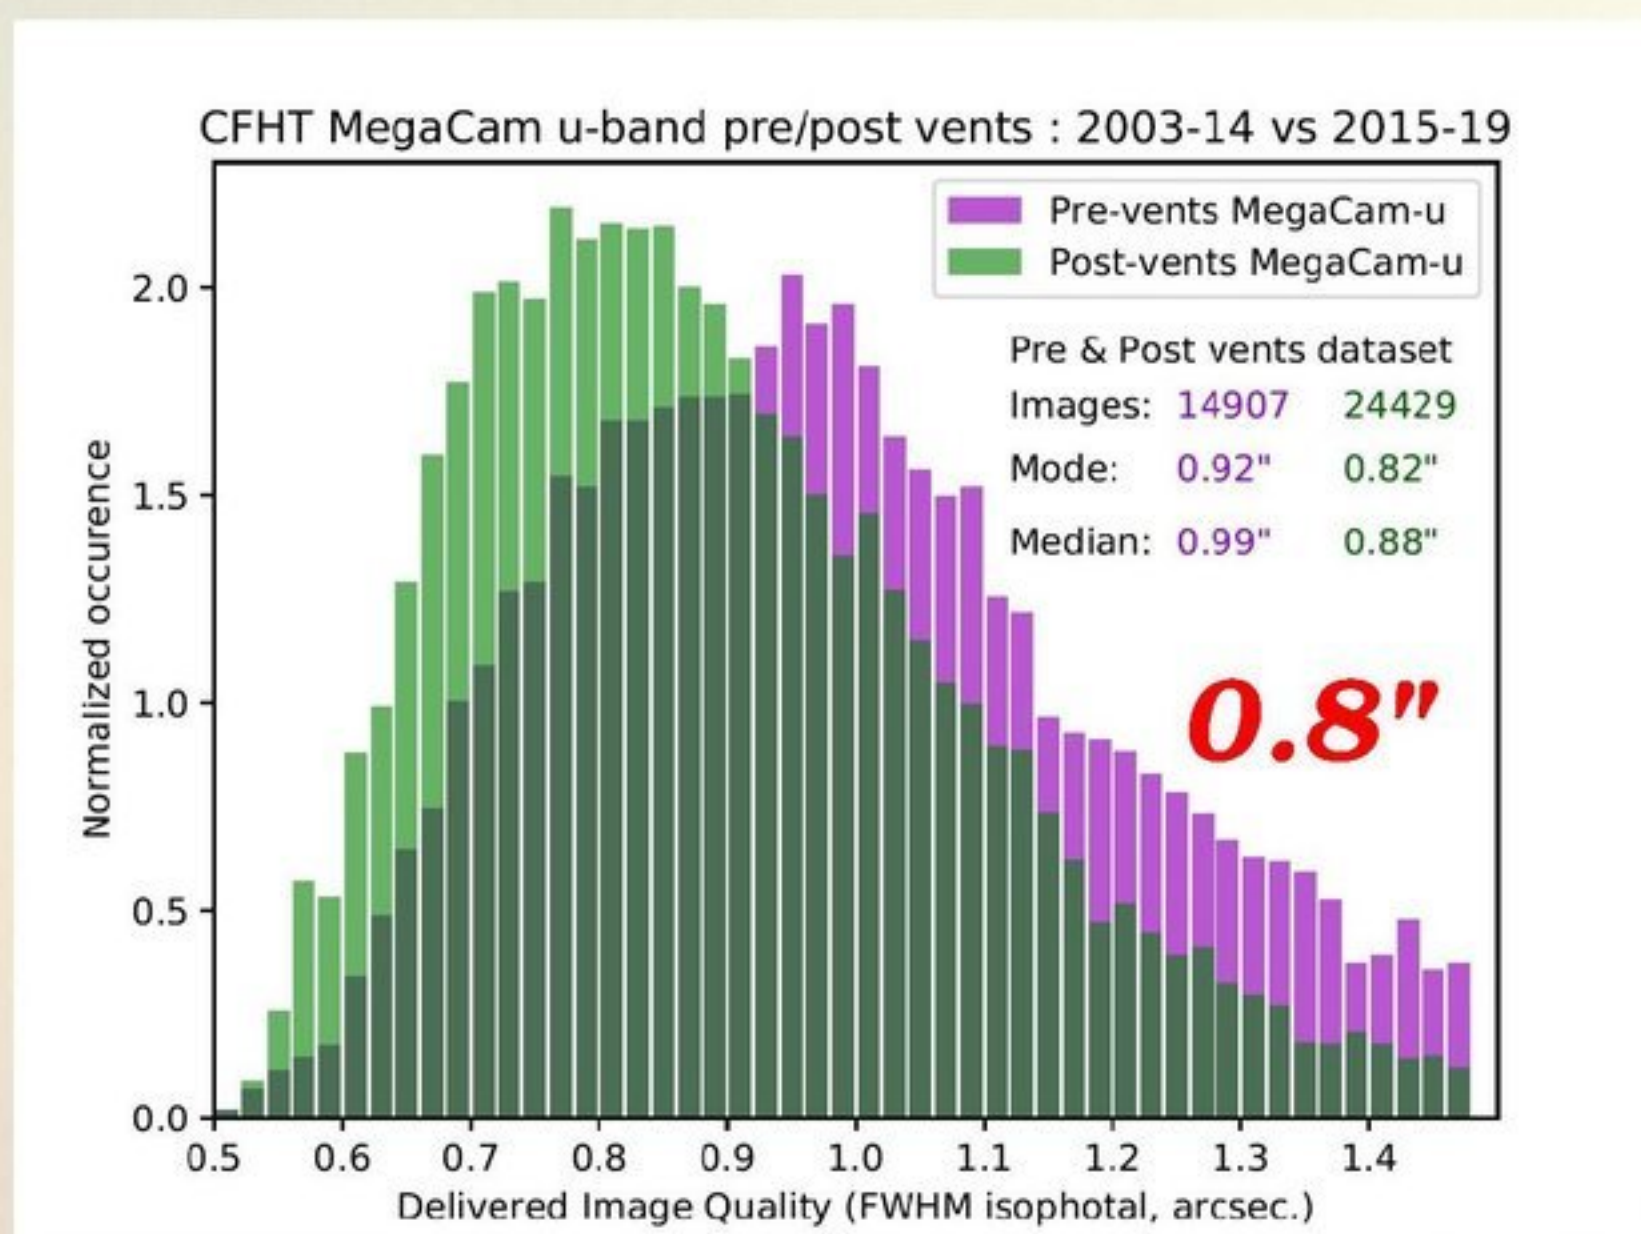

Dynamic integration

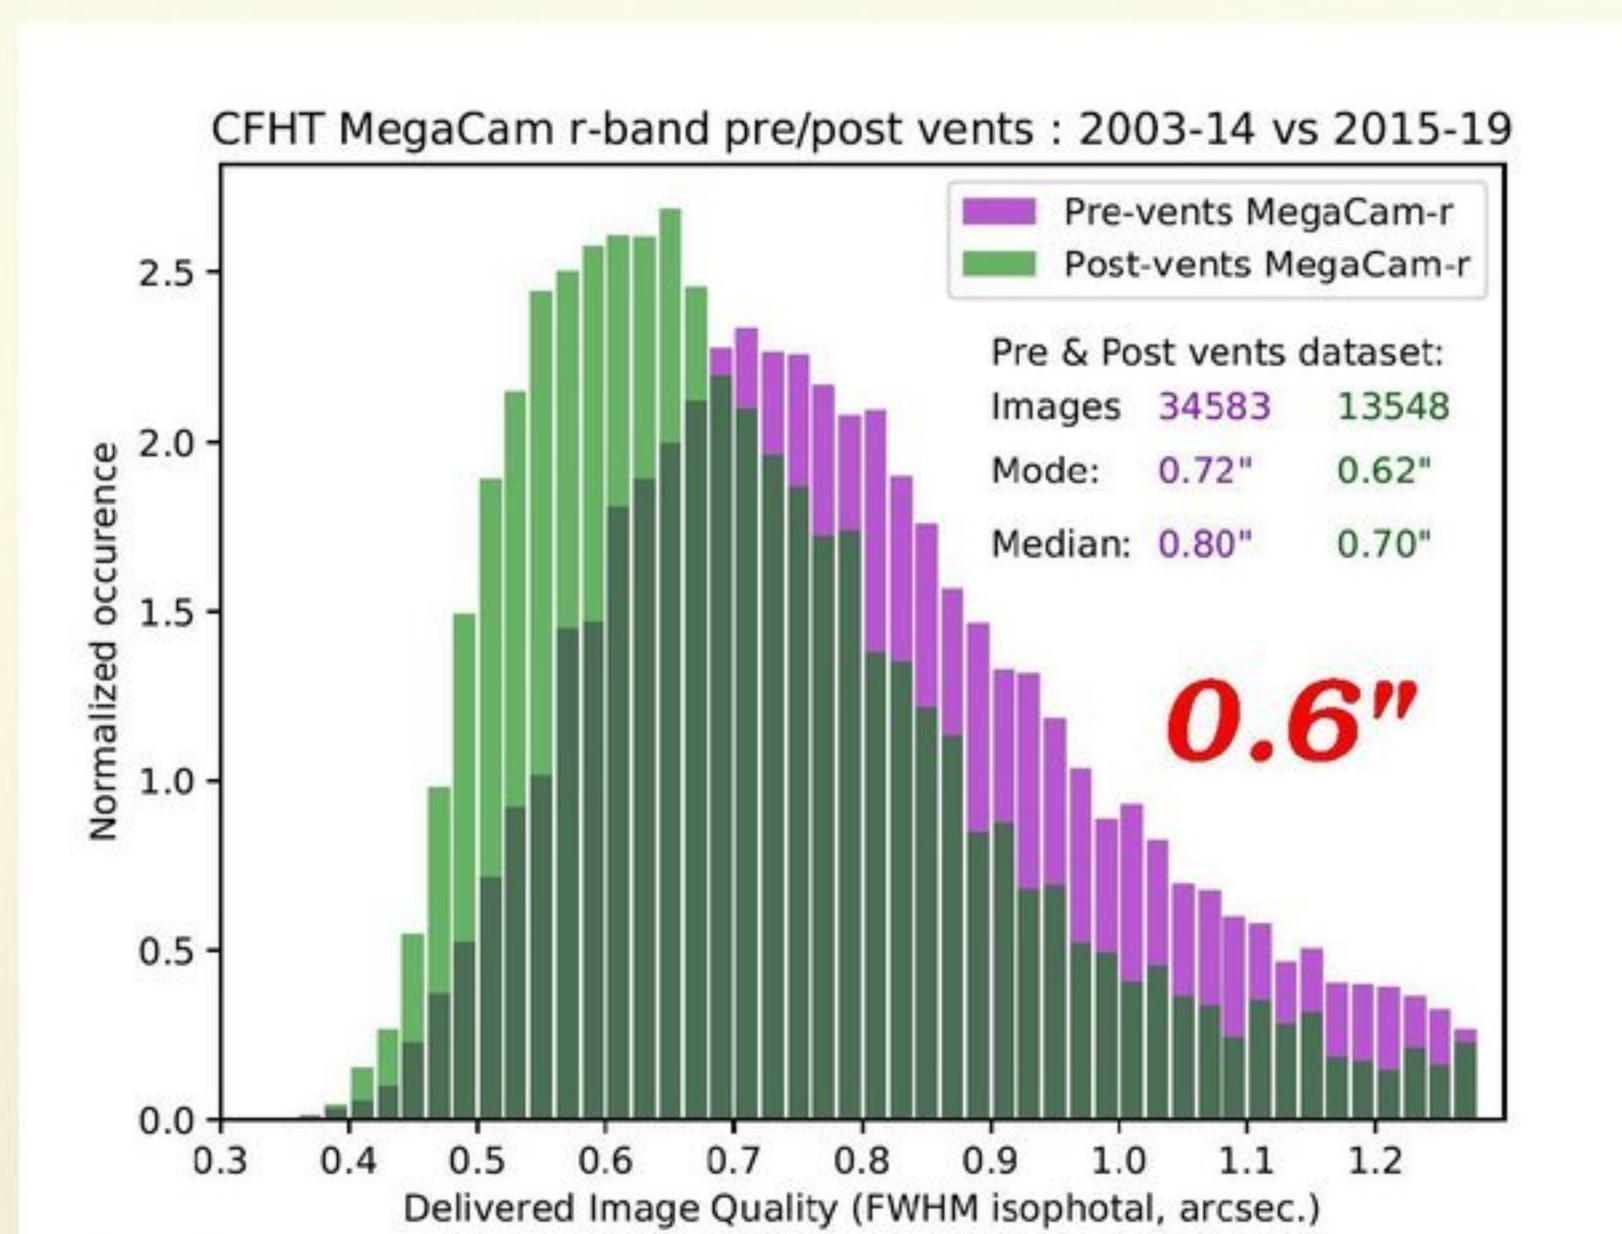

QSO PH2 API

CFIS is focused on CFHT's excellence

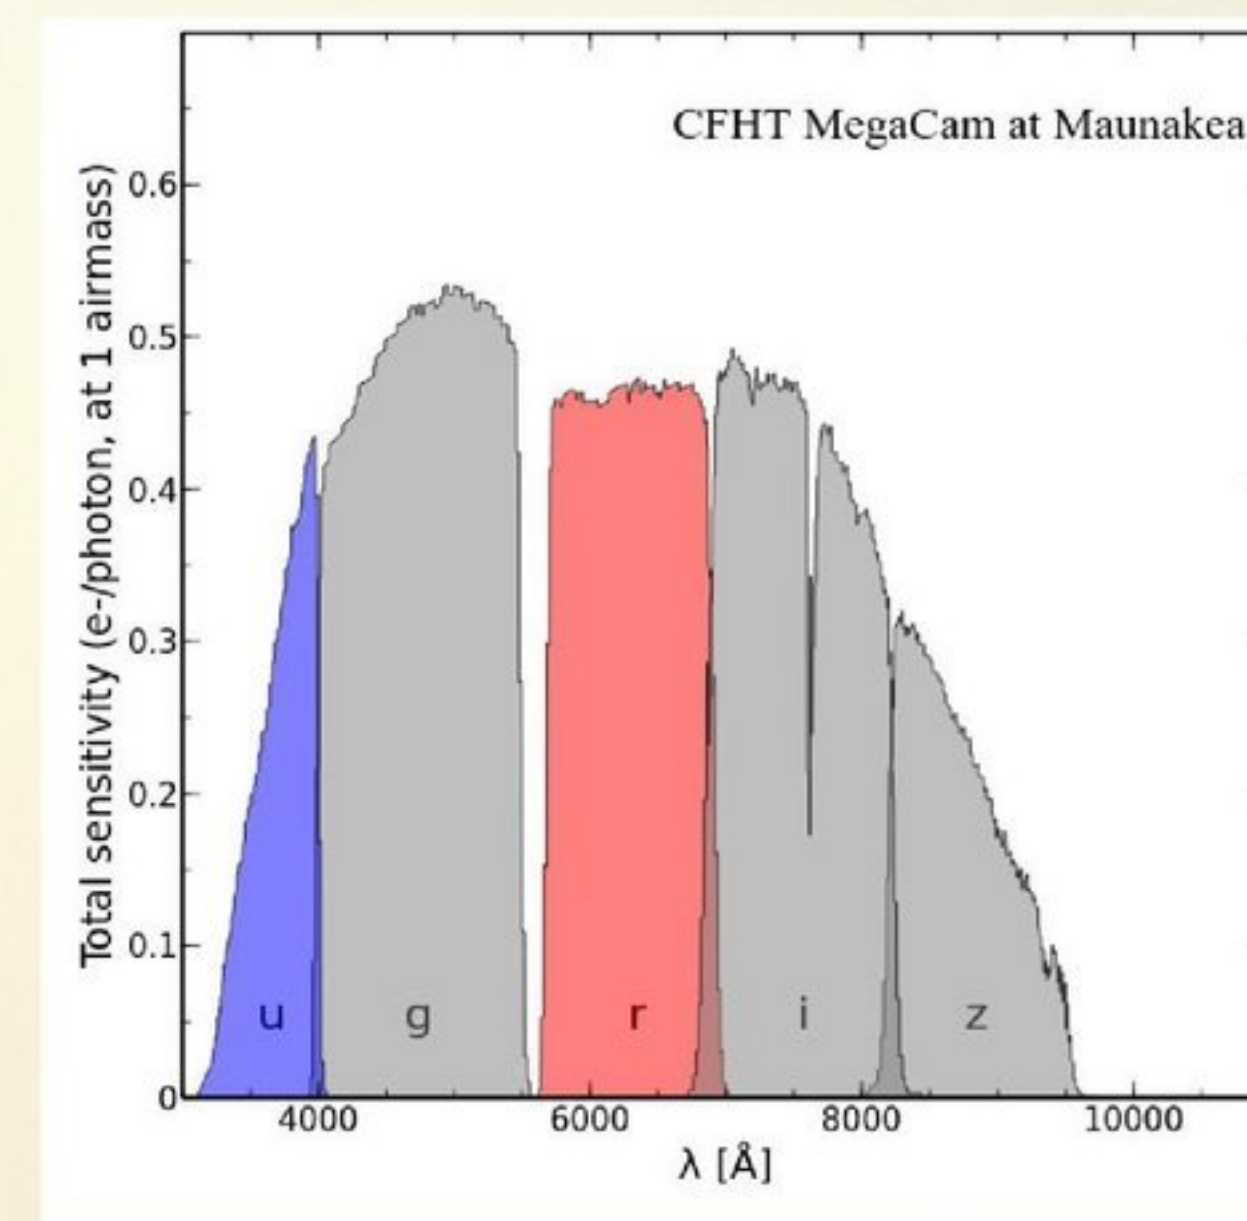

Best u-band sensitivity and image quality in the world over a wide field

Dome venting: 0.1" gain in u

Dome venting: 0.1" gain in r

High throughput

CFIS observing strategy optimized for point source and LSB science

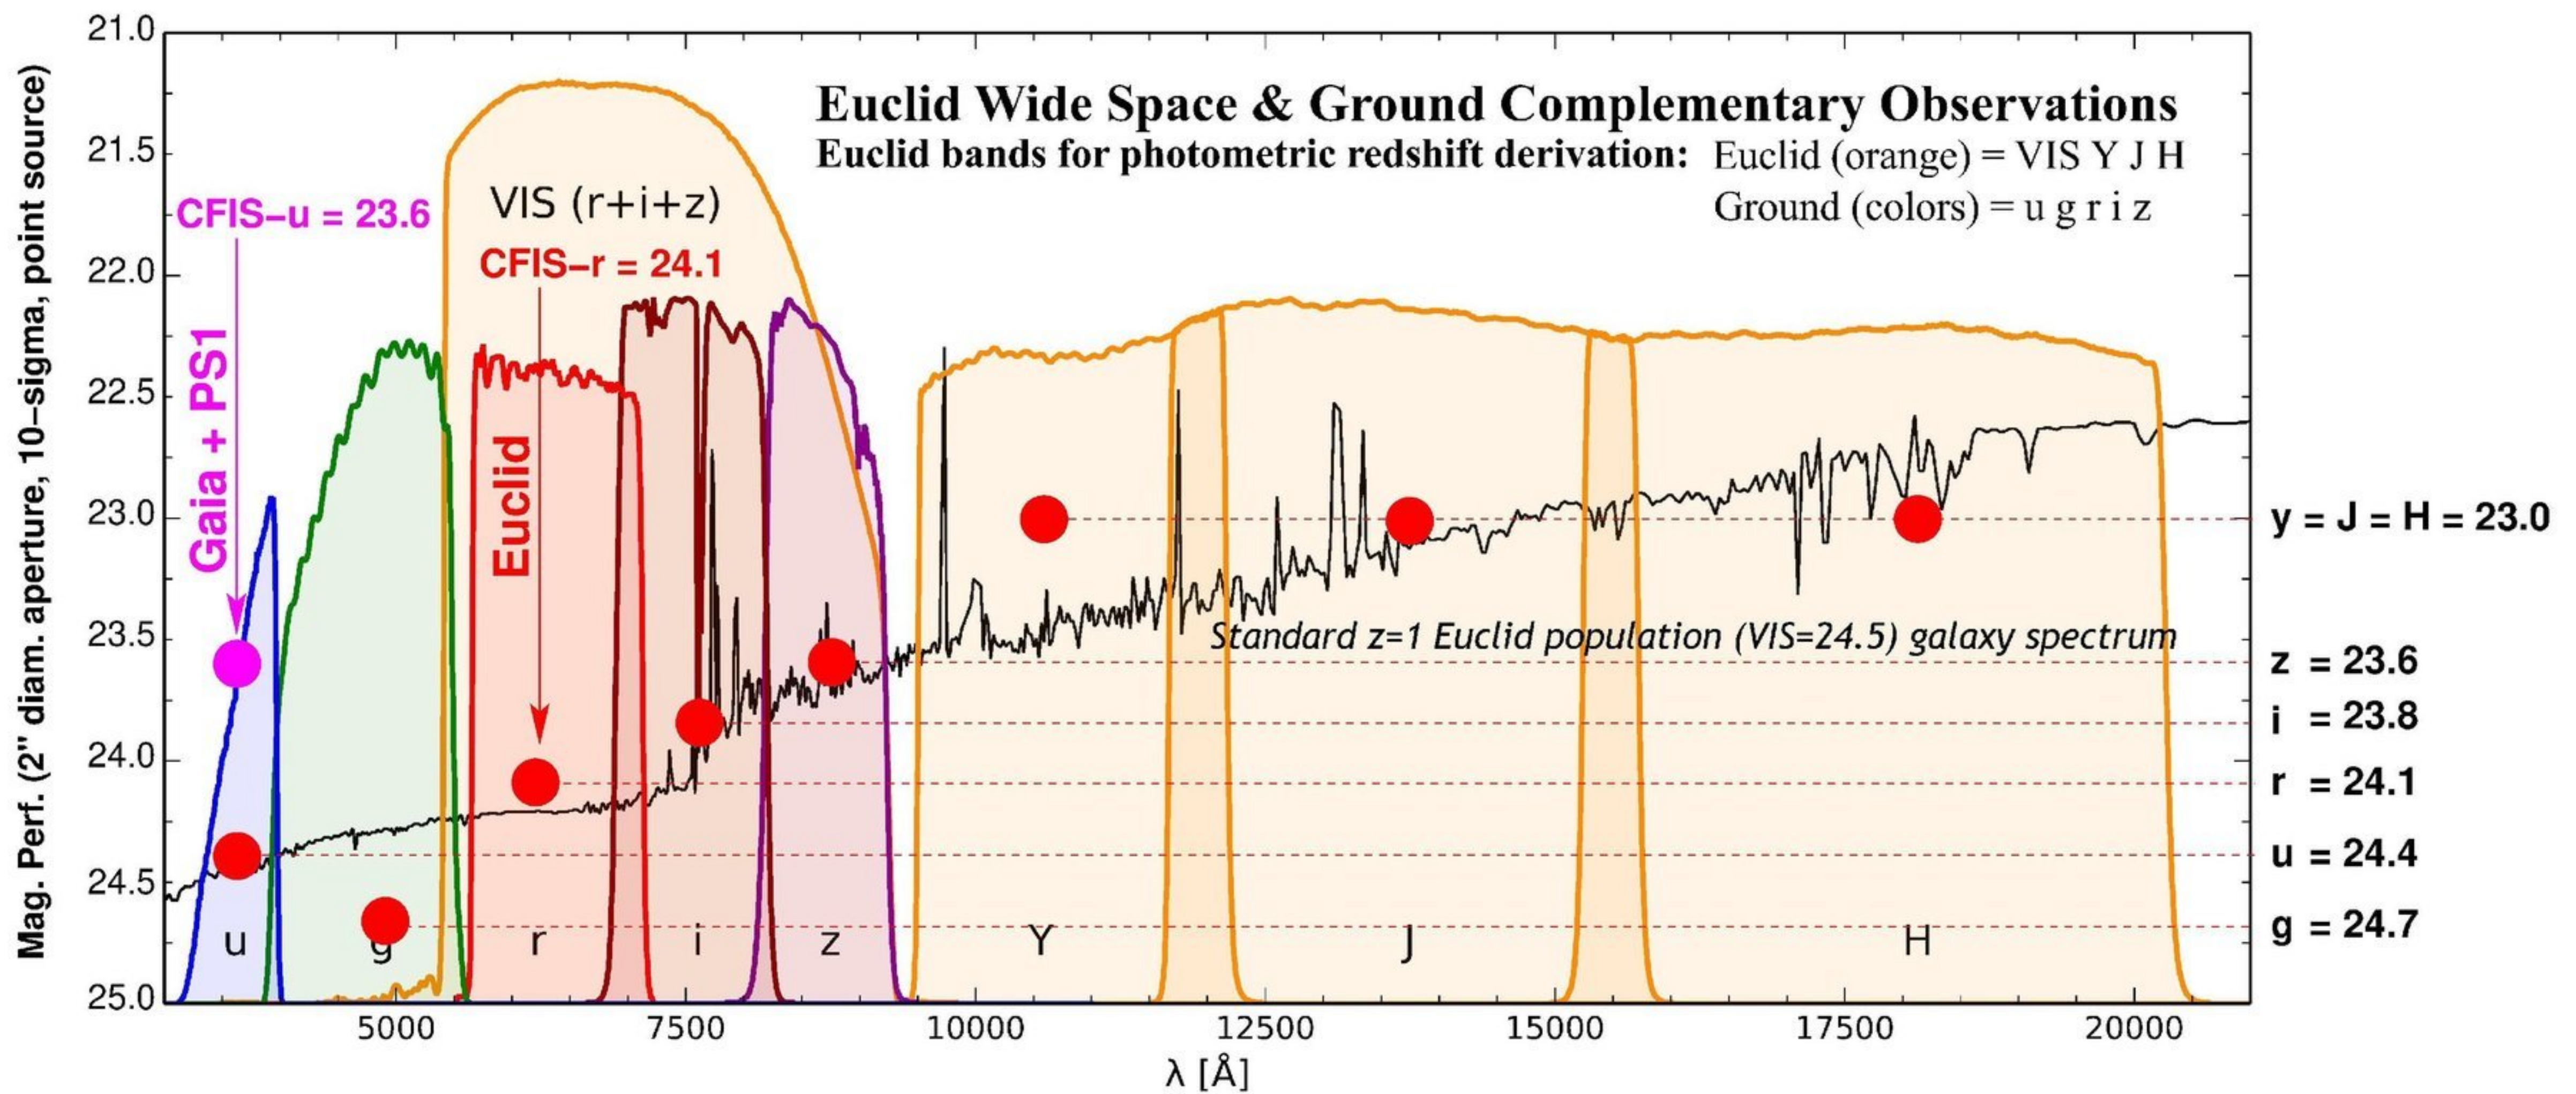

Large FOV: 1.1 deg. square

Elixir-LSB

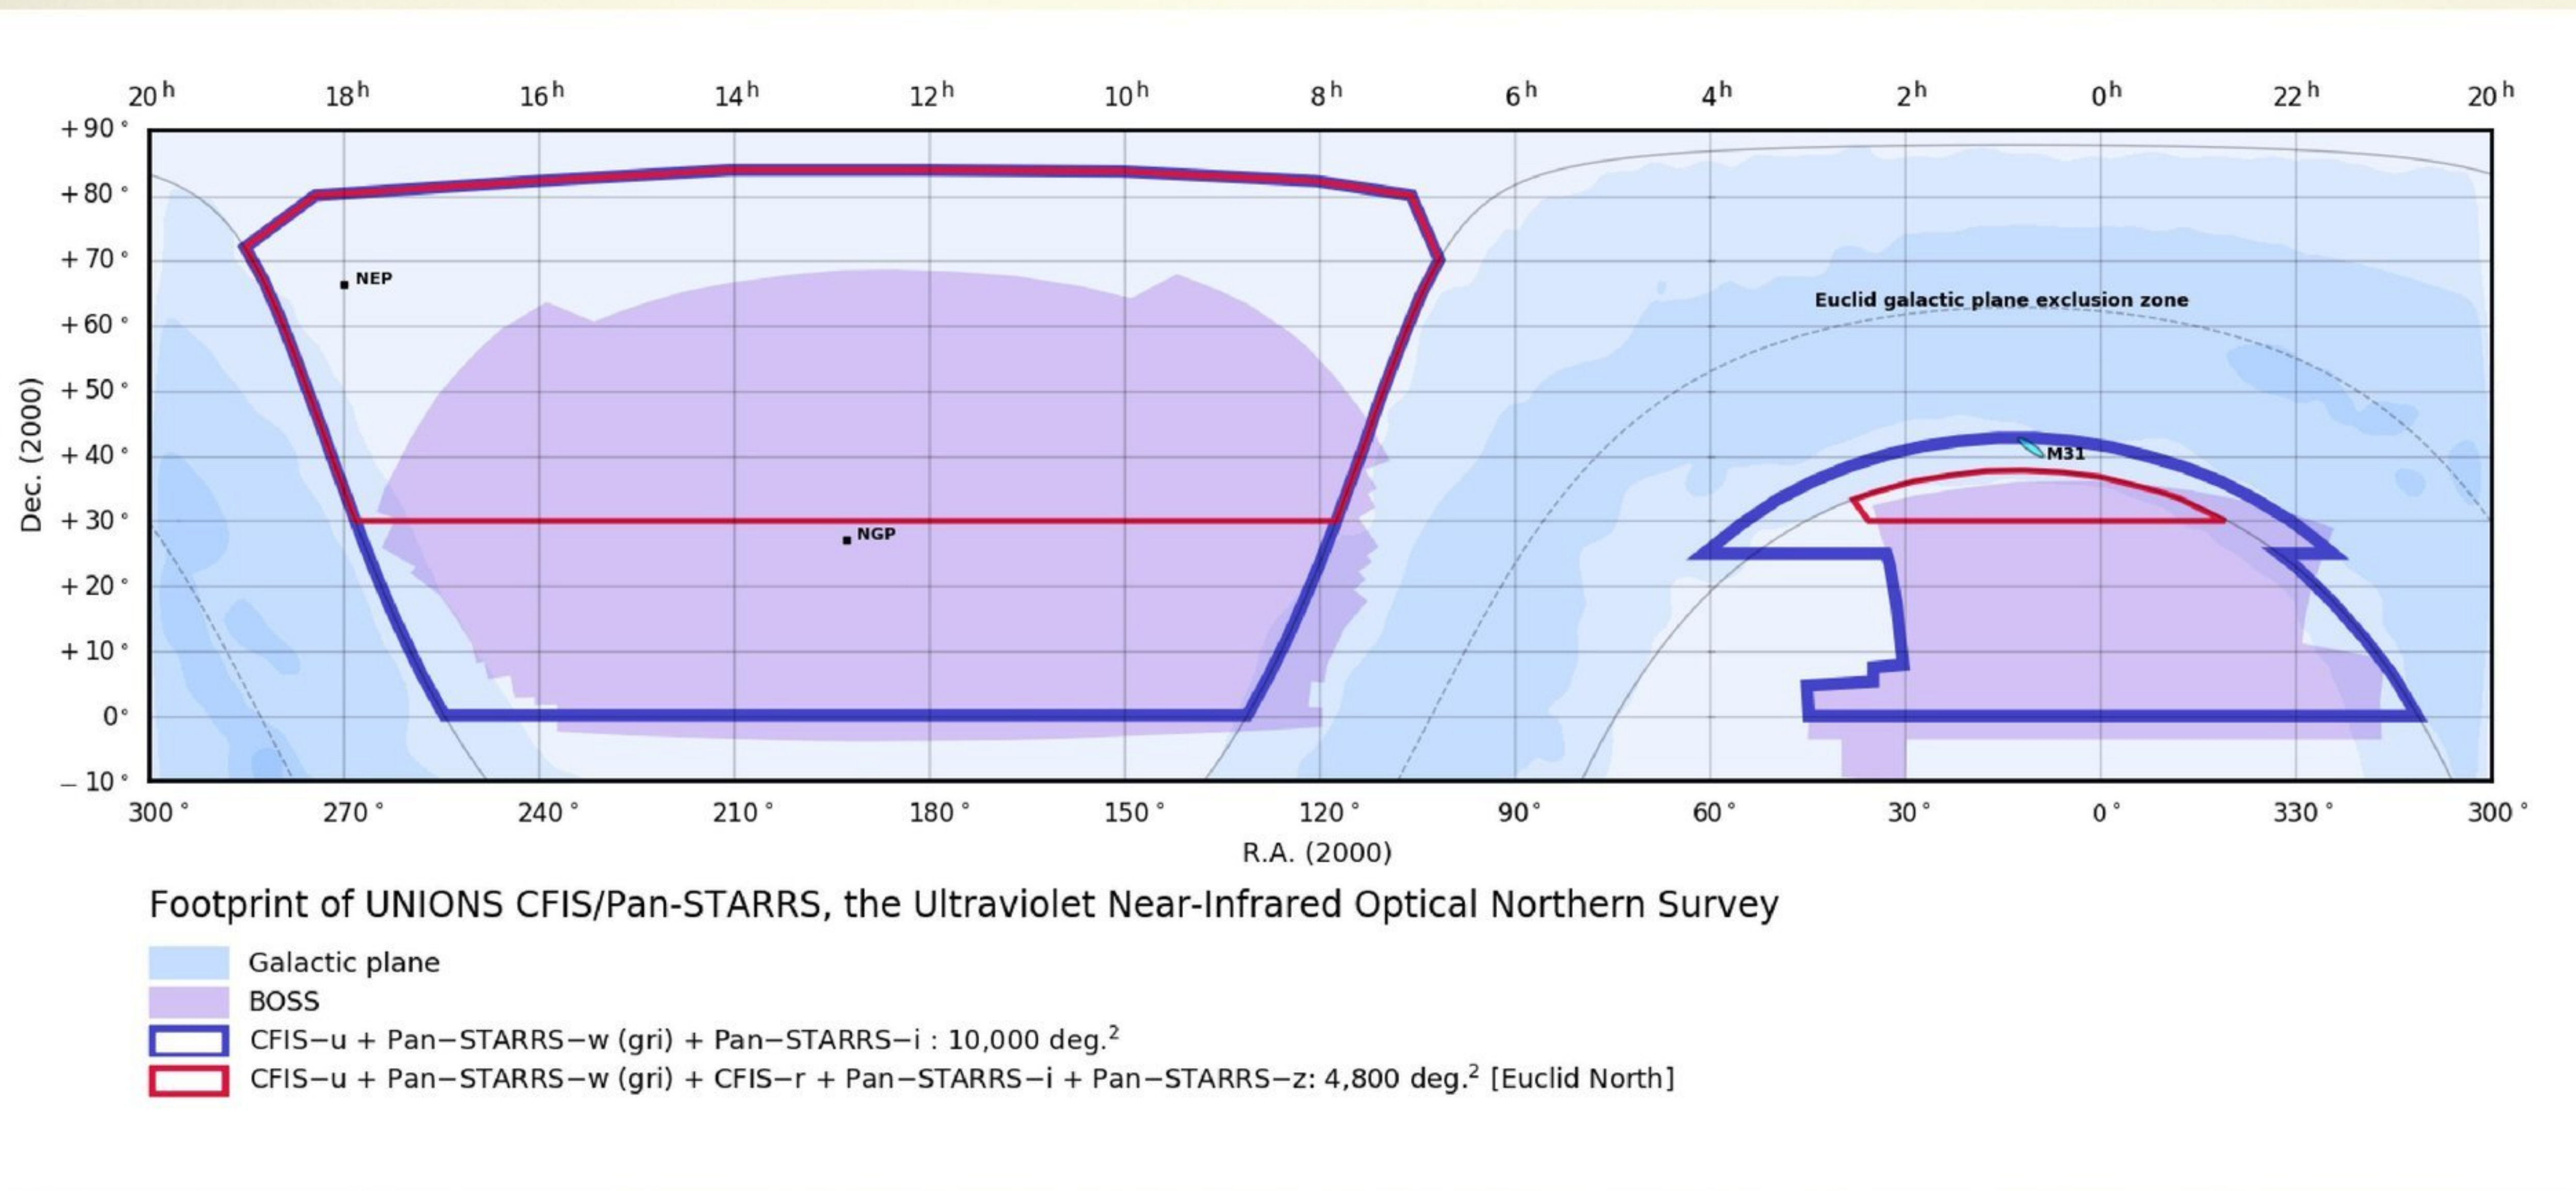

- + Fast readout
- + Dynamic integration
- + QSO PH2 API

CFIS depths are driven by two ESA space missions

CFIS-u depth is driven by Gaia & Pan-STARRS (PS1), CFIS-r depth set by Euclid photo-z

CFIS sky coverage : the northern sky

CFIS-r : priority goes to the BOSS area (CFIS core science)

CFIS dataset properties

A high quality dataset

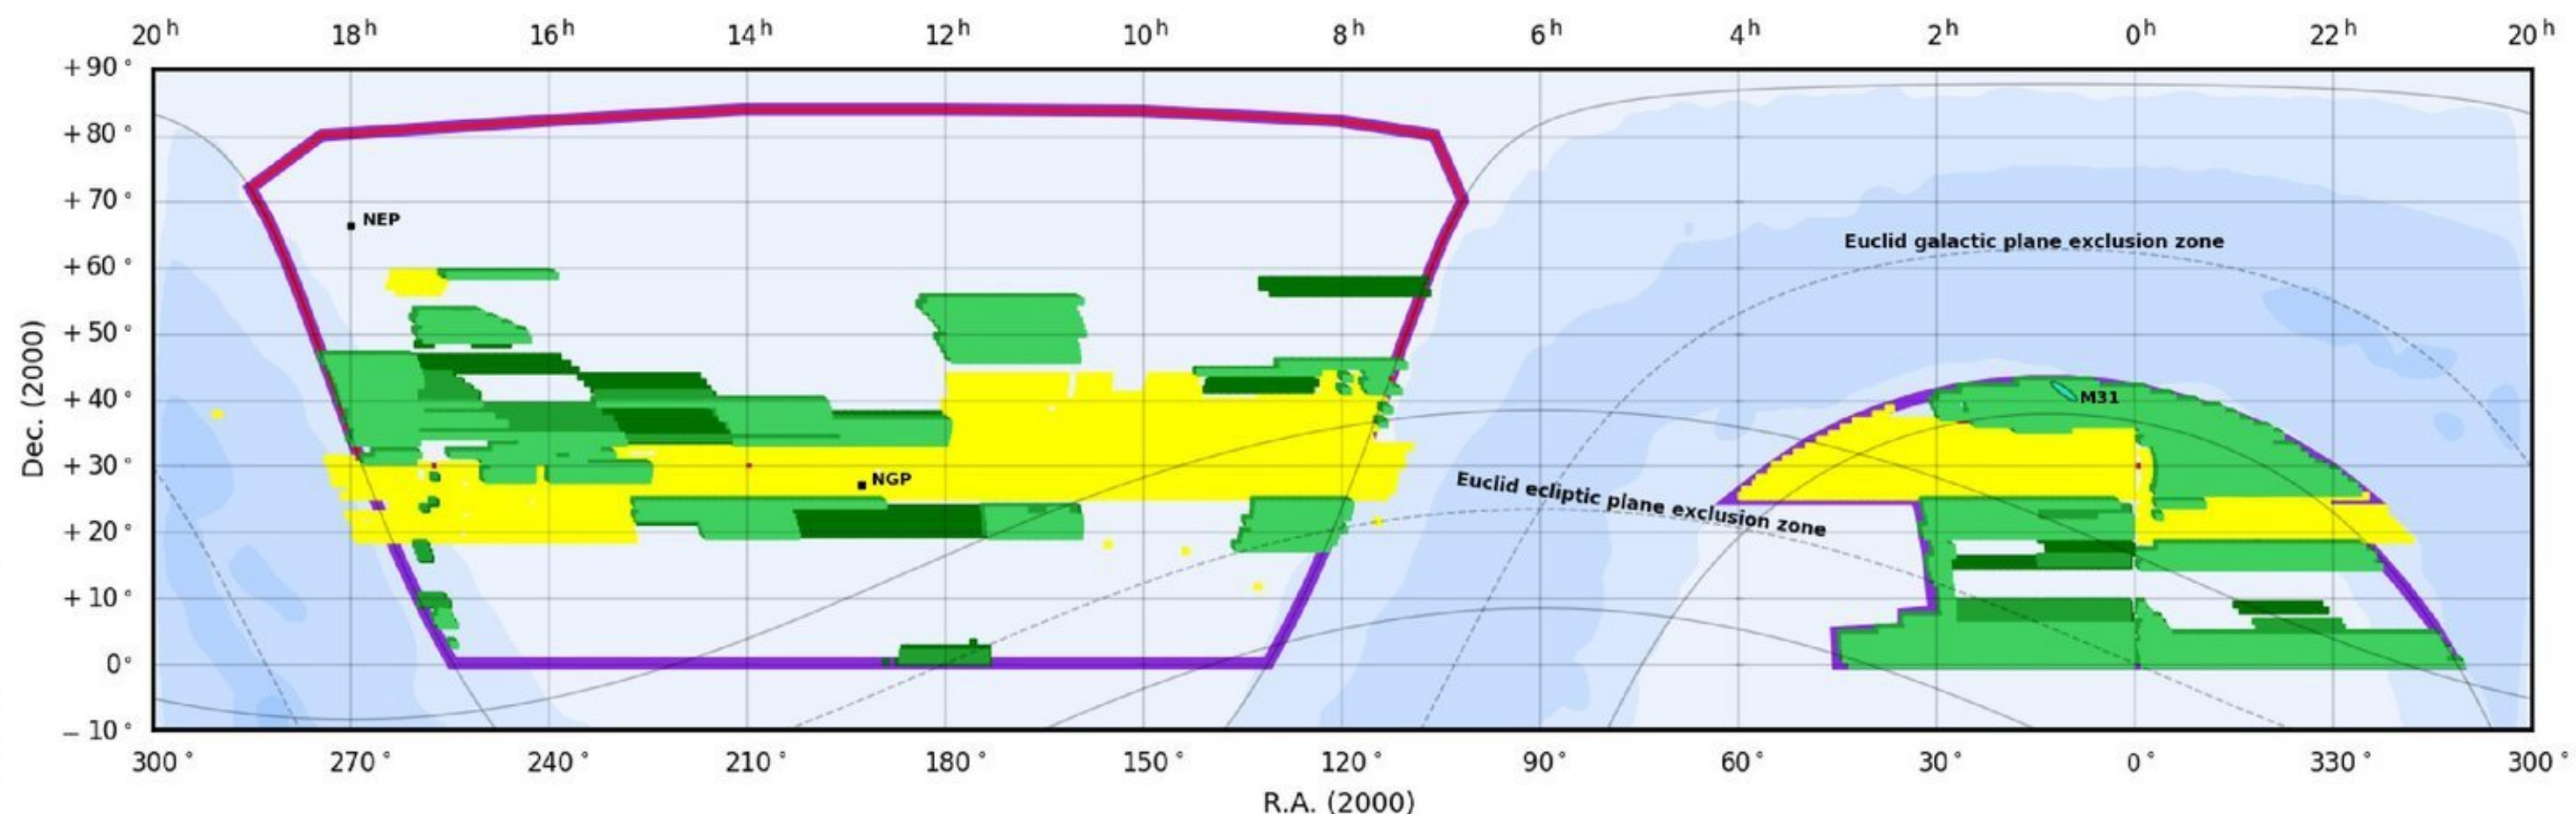

Planned depths achieved (MegaPipe stacks)

Crop of a single frame (r-band, 0.51")

CFIS-u progress and completion forecast

CFIS-u sky coverage completed as of April 2019

- Galactic plane
- CFIS-u : 10,000 deg.² with priority to DEC>25 deg.
- CFIS-r + Pan-STARRS-iz + JEDIS-g: 4,800 deg.² [Euclid North]
- Luau full depth with 3 exposures: 2608 deg.² (2015-2016)

- CFIS-u covered with 1 exposure (1st pass): ~ 2973 deg.²
- CFIS-u covered with 2 exposures (2nd pass): ~ 2495 deg.²
- CFIS-u covered with 3 exposures (full depth): ~ 2088 deg.²

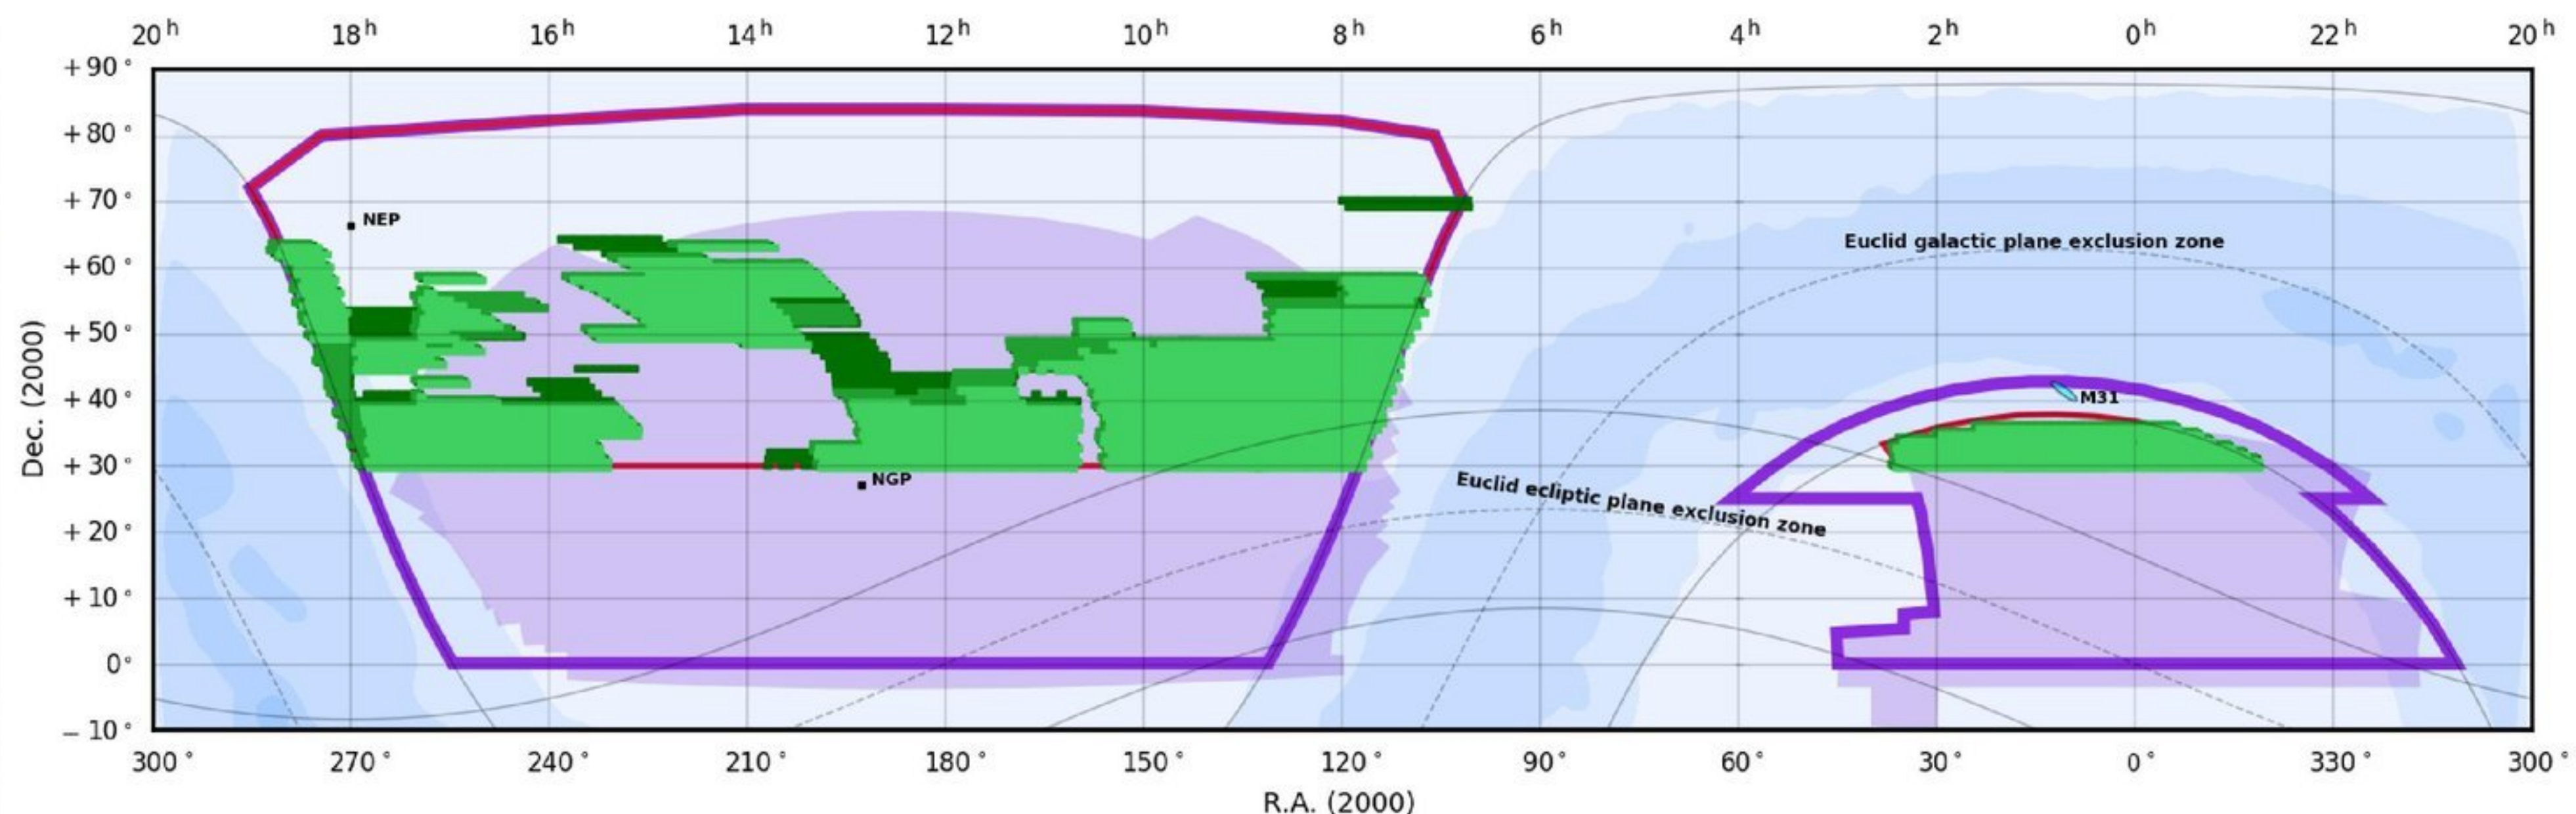

CFIS-u realized QSO validation & projections

For the 117 nights allocated in 2016 by SAC = 85% of the submitted proposal

CFIS-r progress and completion forecast

CFIS-r sky coverage completed as of April 2019

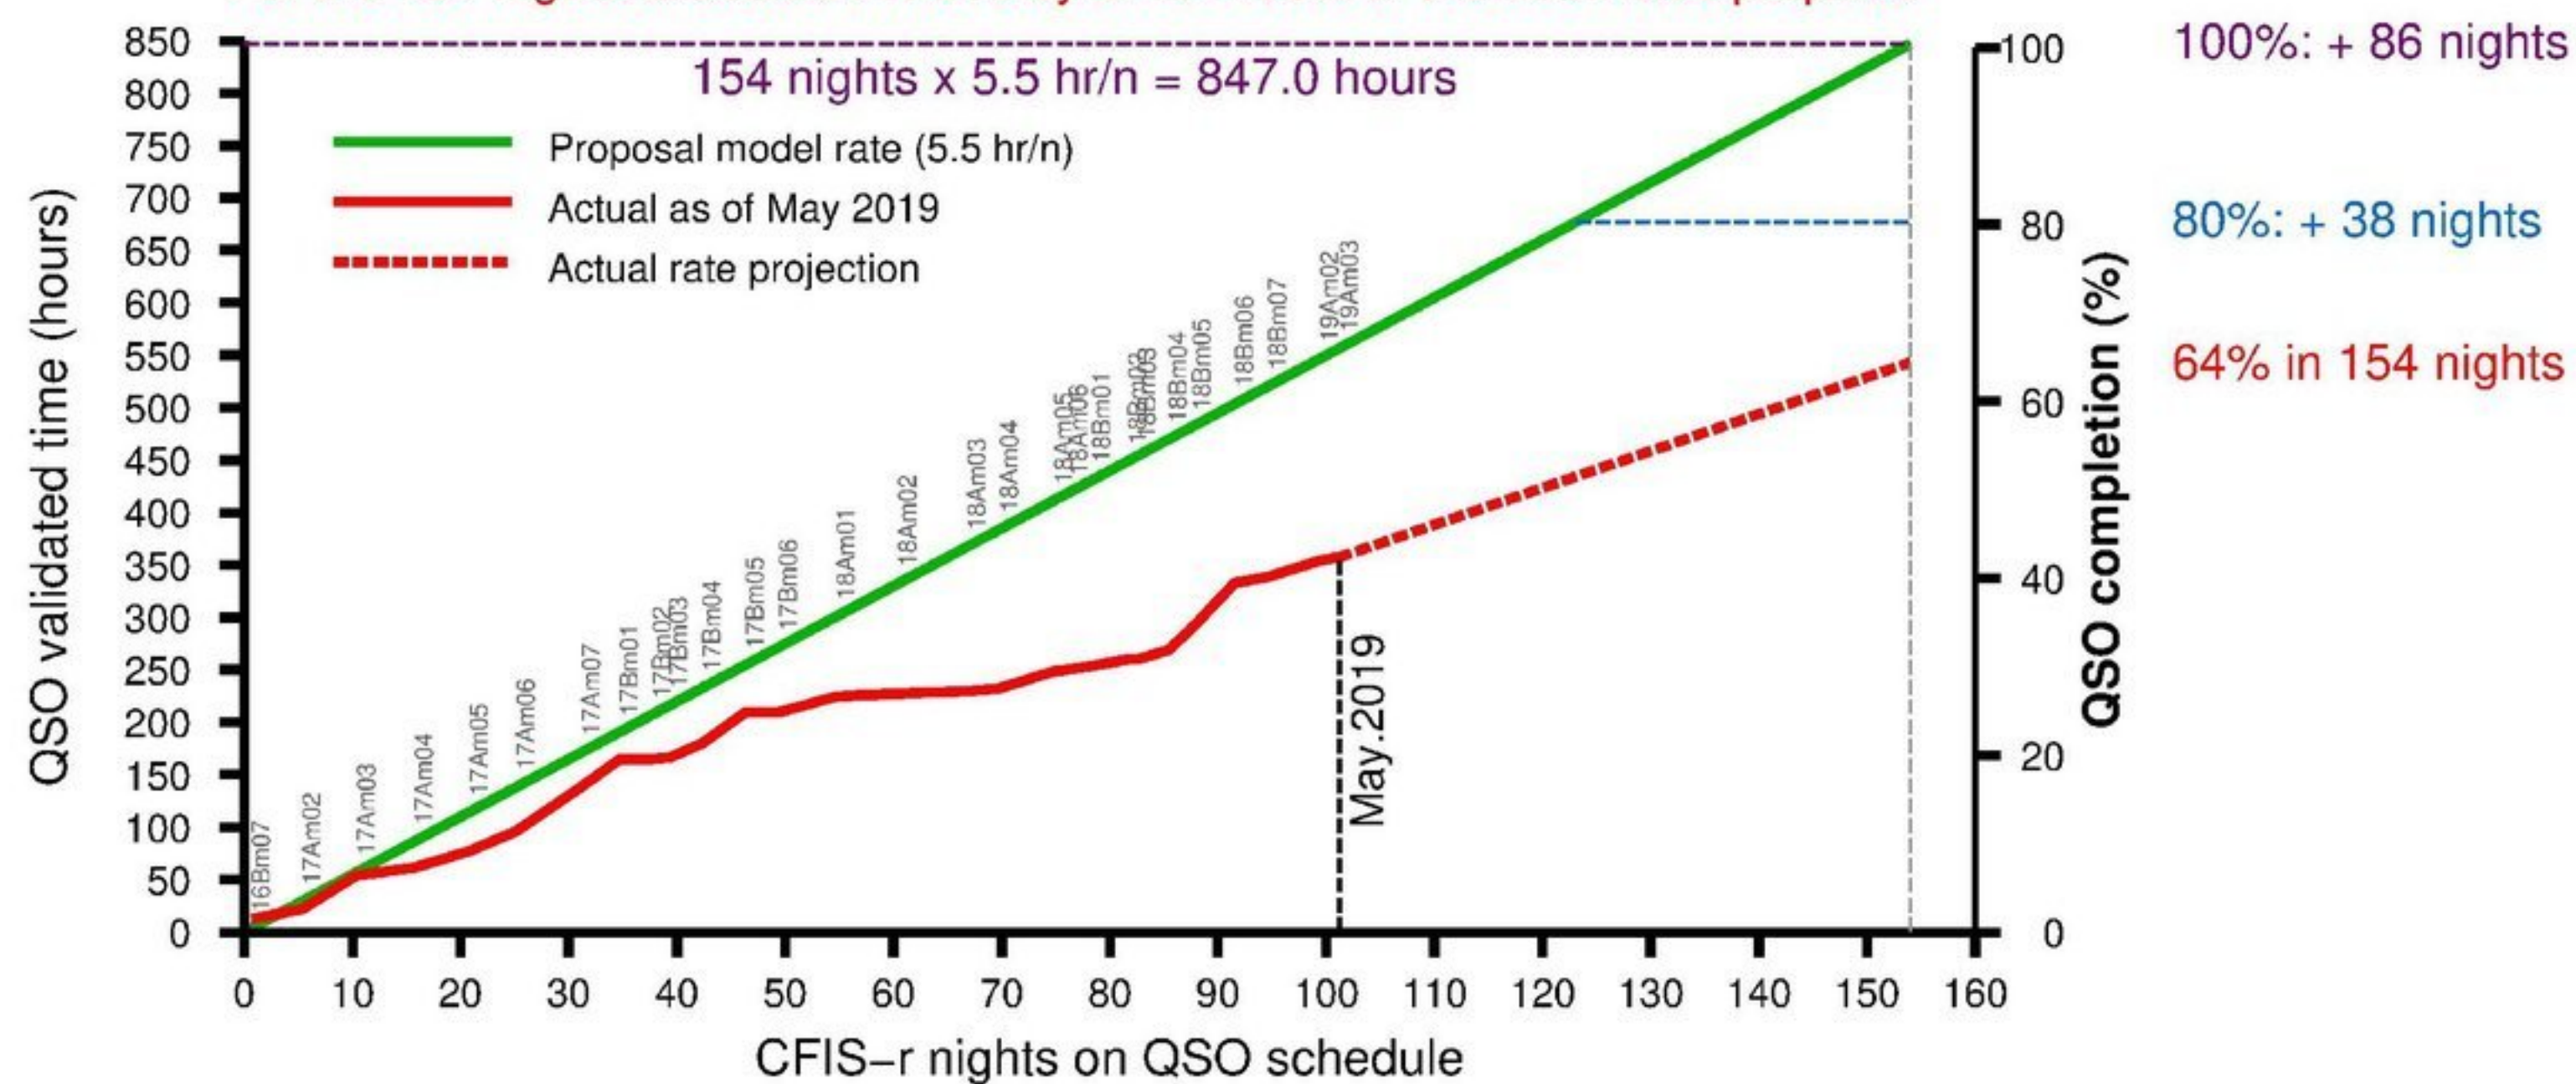

- Galactic plane
- BOSS
- CFIS-u : 10,000 deg.² with priority to DEC>25 deg.
- CFIS-r + Pan-STARRS-iz + JEDIS-g: 4,800 deg.² [Euclid North]

- CFIS-r covered with 1 exposure (1st pass): ~ 2478 deg.²
- CFIS-r covered with 2 exposures (2nd pass): ~ 2217 deg.²
- CFIS-r covered with 3 exposures (full depth): ~ 2051 deg.²

CFIS-r realized QSO validation & projections

For the 154 nights allocated in 2016 by SAC = 85% of the submitted proposal

The worst weather in 30 years on Maunakea

15 years of MegaCam operations versus weather

Summer hurricane #3 (Aug. 2018)

The CFIS seriously lacks sky access

Improved Low Surface Brightness performance

MegaCam u-band halos : old vs new filter

MegaCam r-band halos : old vs new filter

CFHT/Coelum

MegaCam LSB performance reached x3 faster

CFIS-r: 1st blind all-sky LSB survey

A 25 square degrees CFIS-r LSB patch (M101 area)

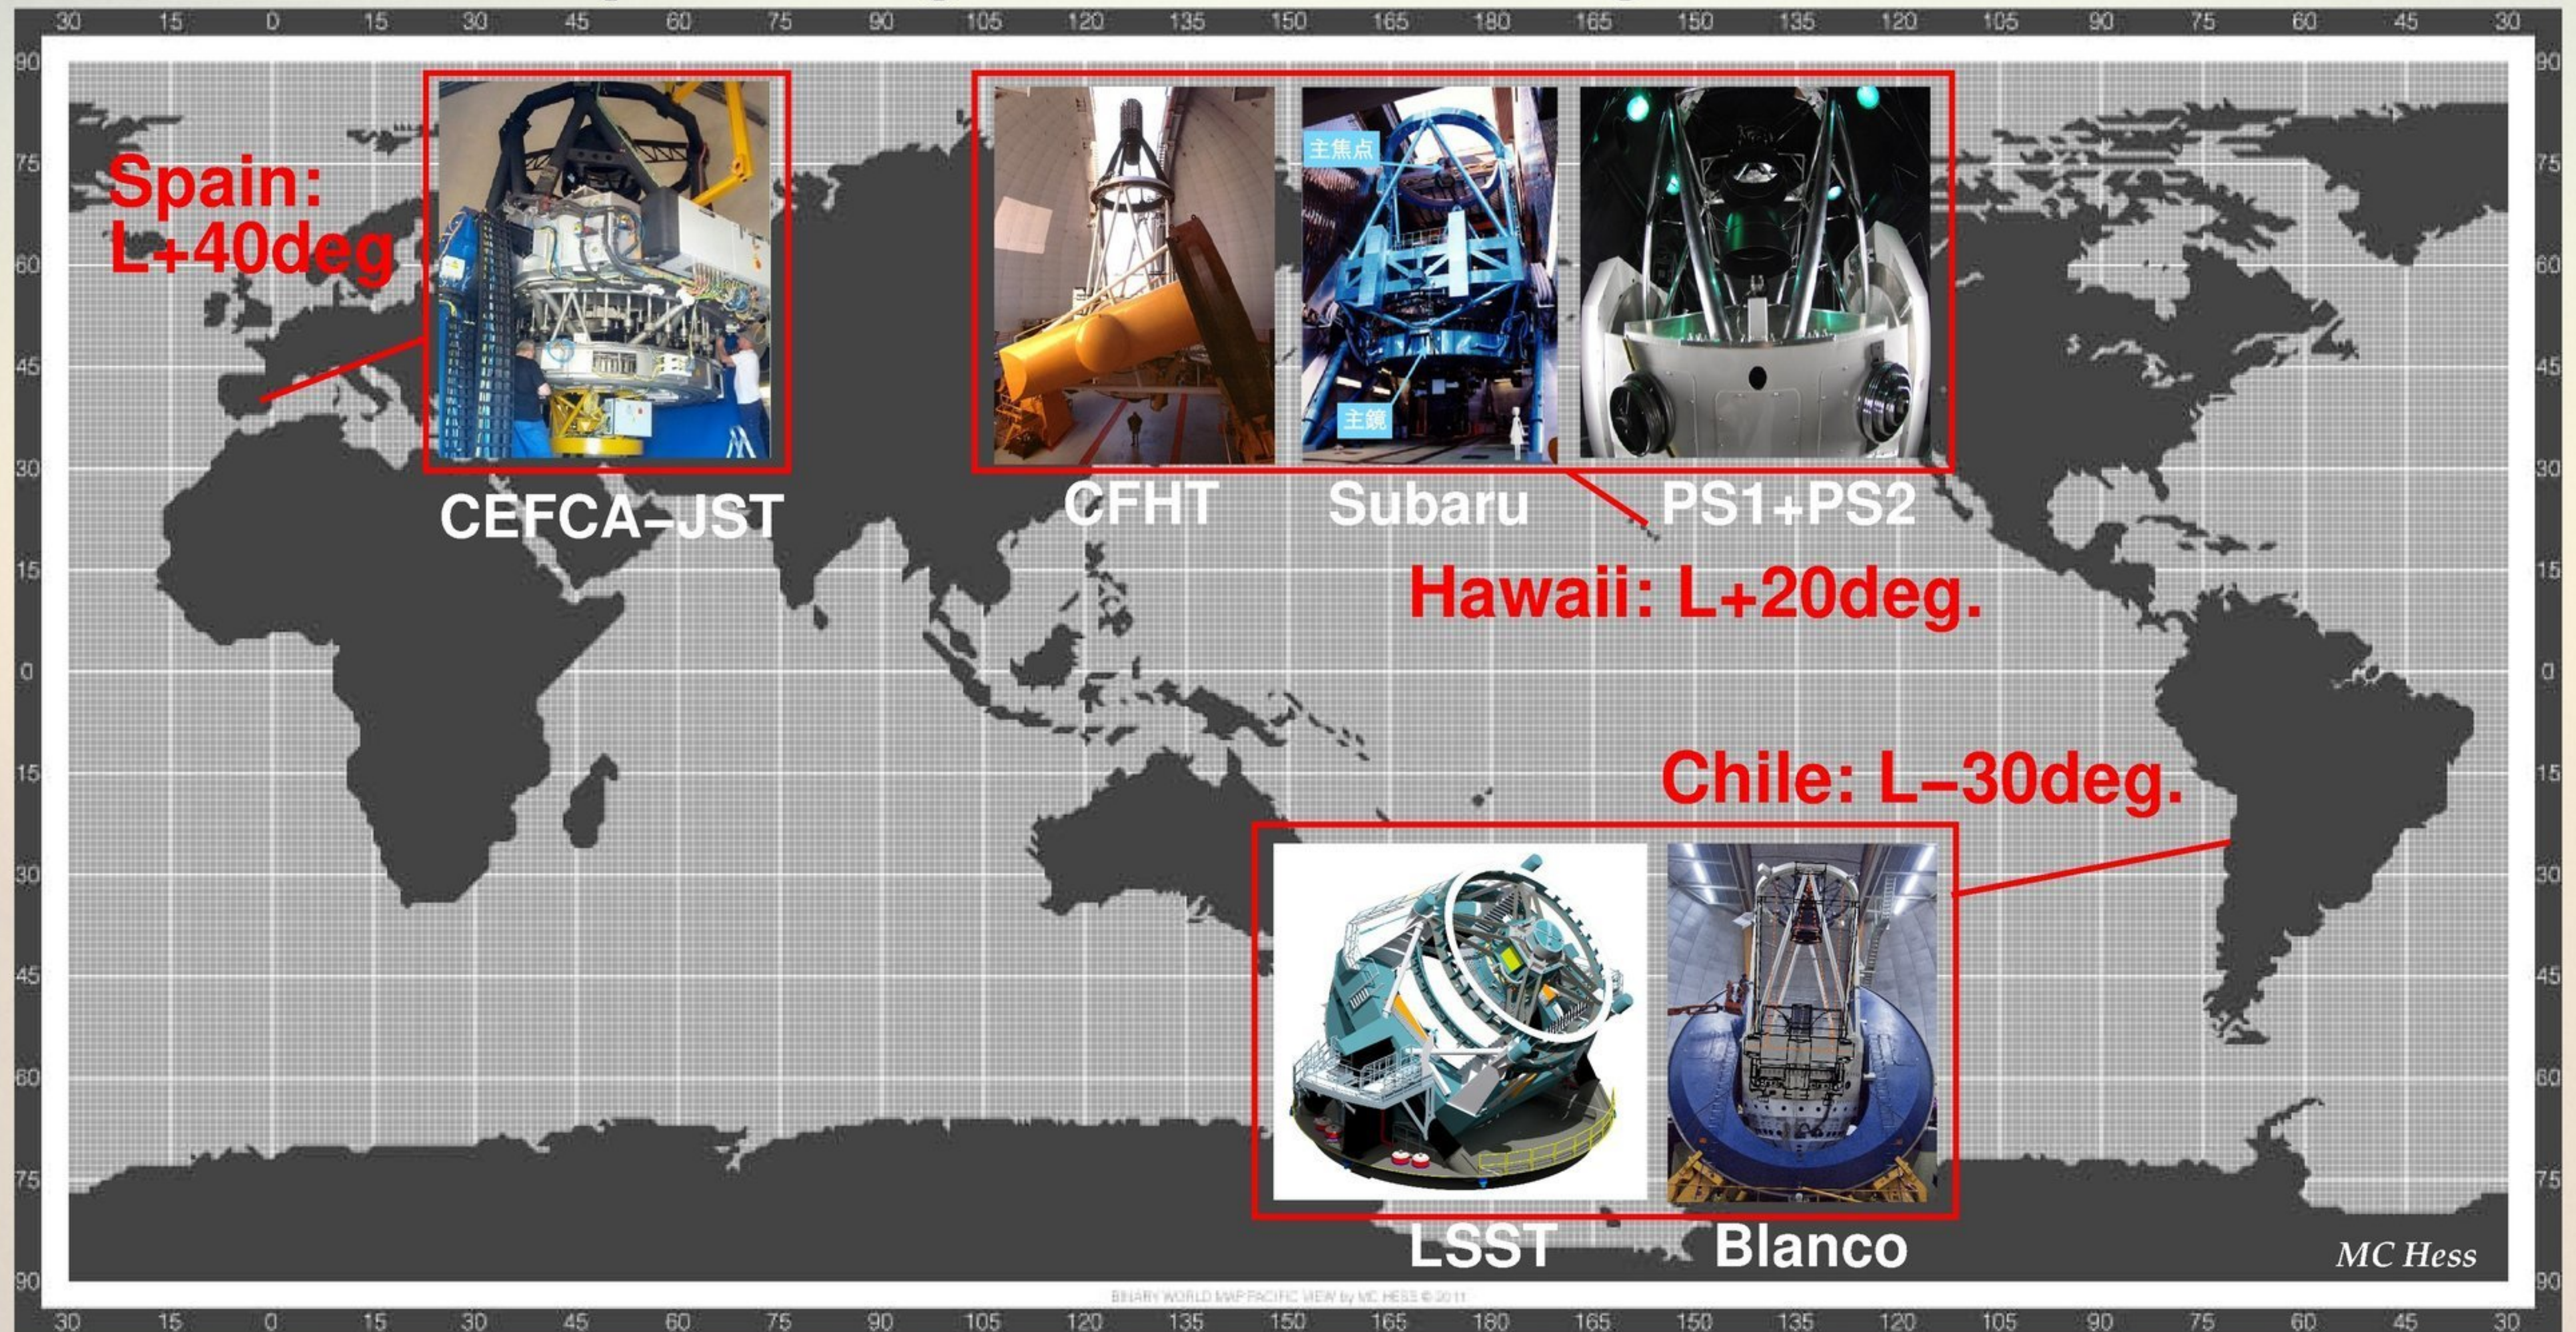

Messier 101 : disk to 28 mag/arcsec²

28 mag./arcsec² = new sky window

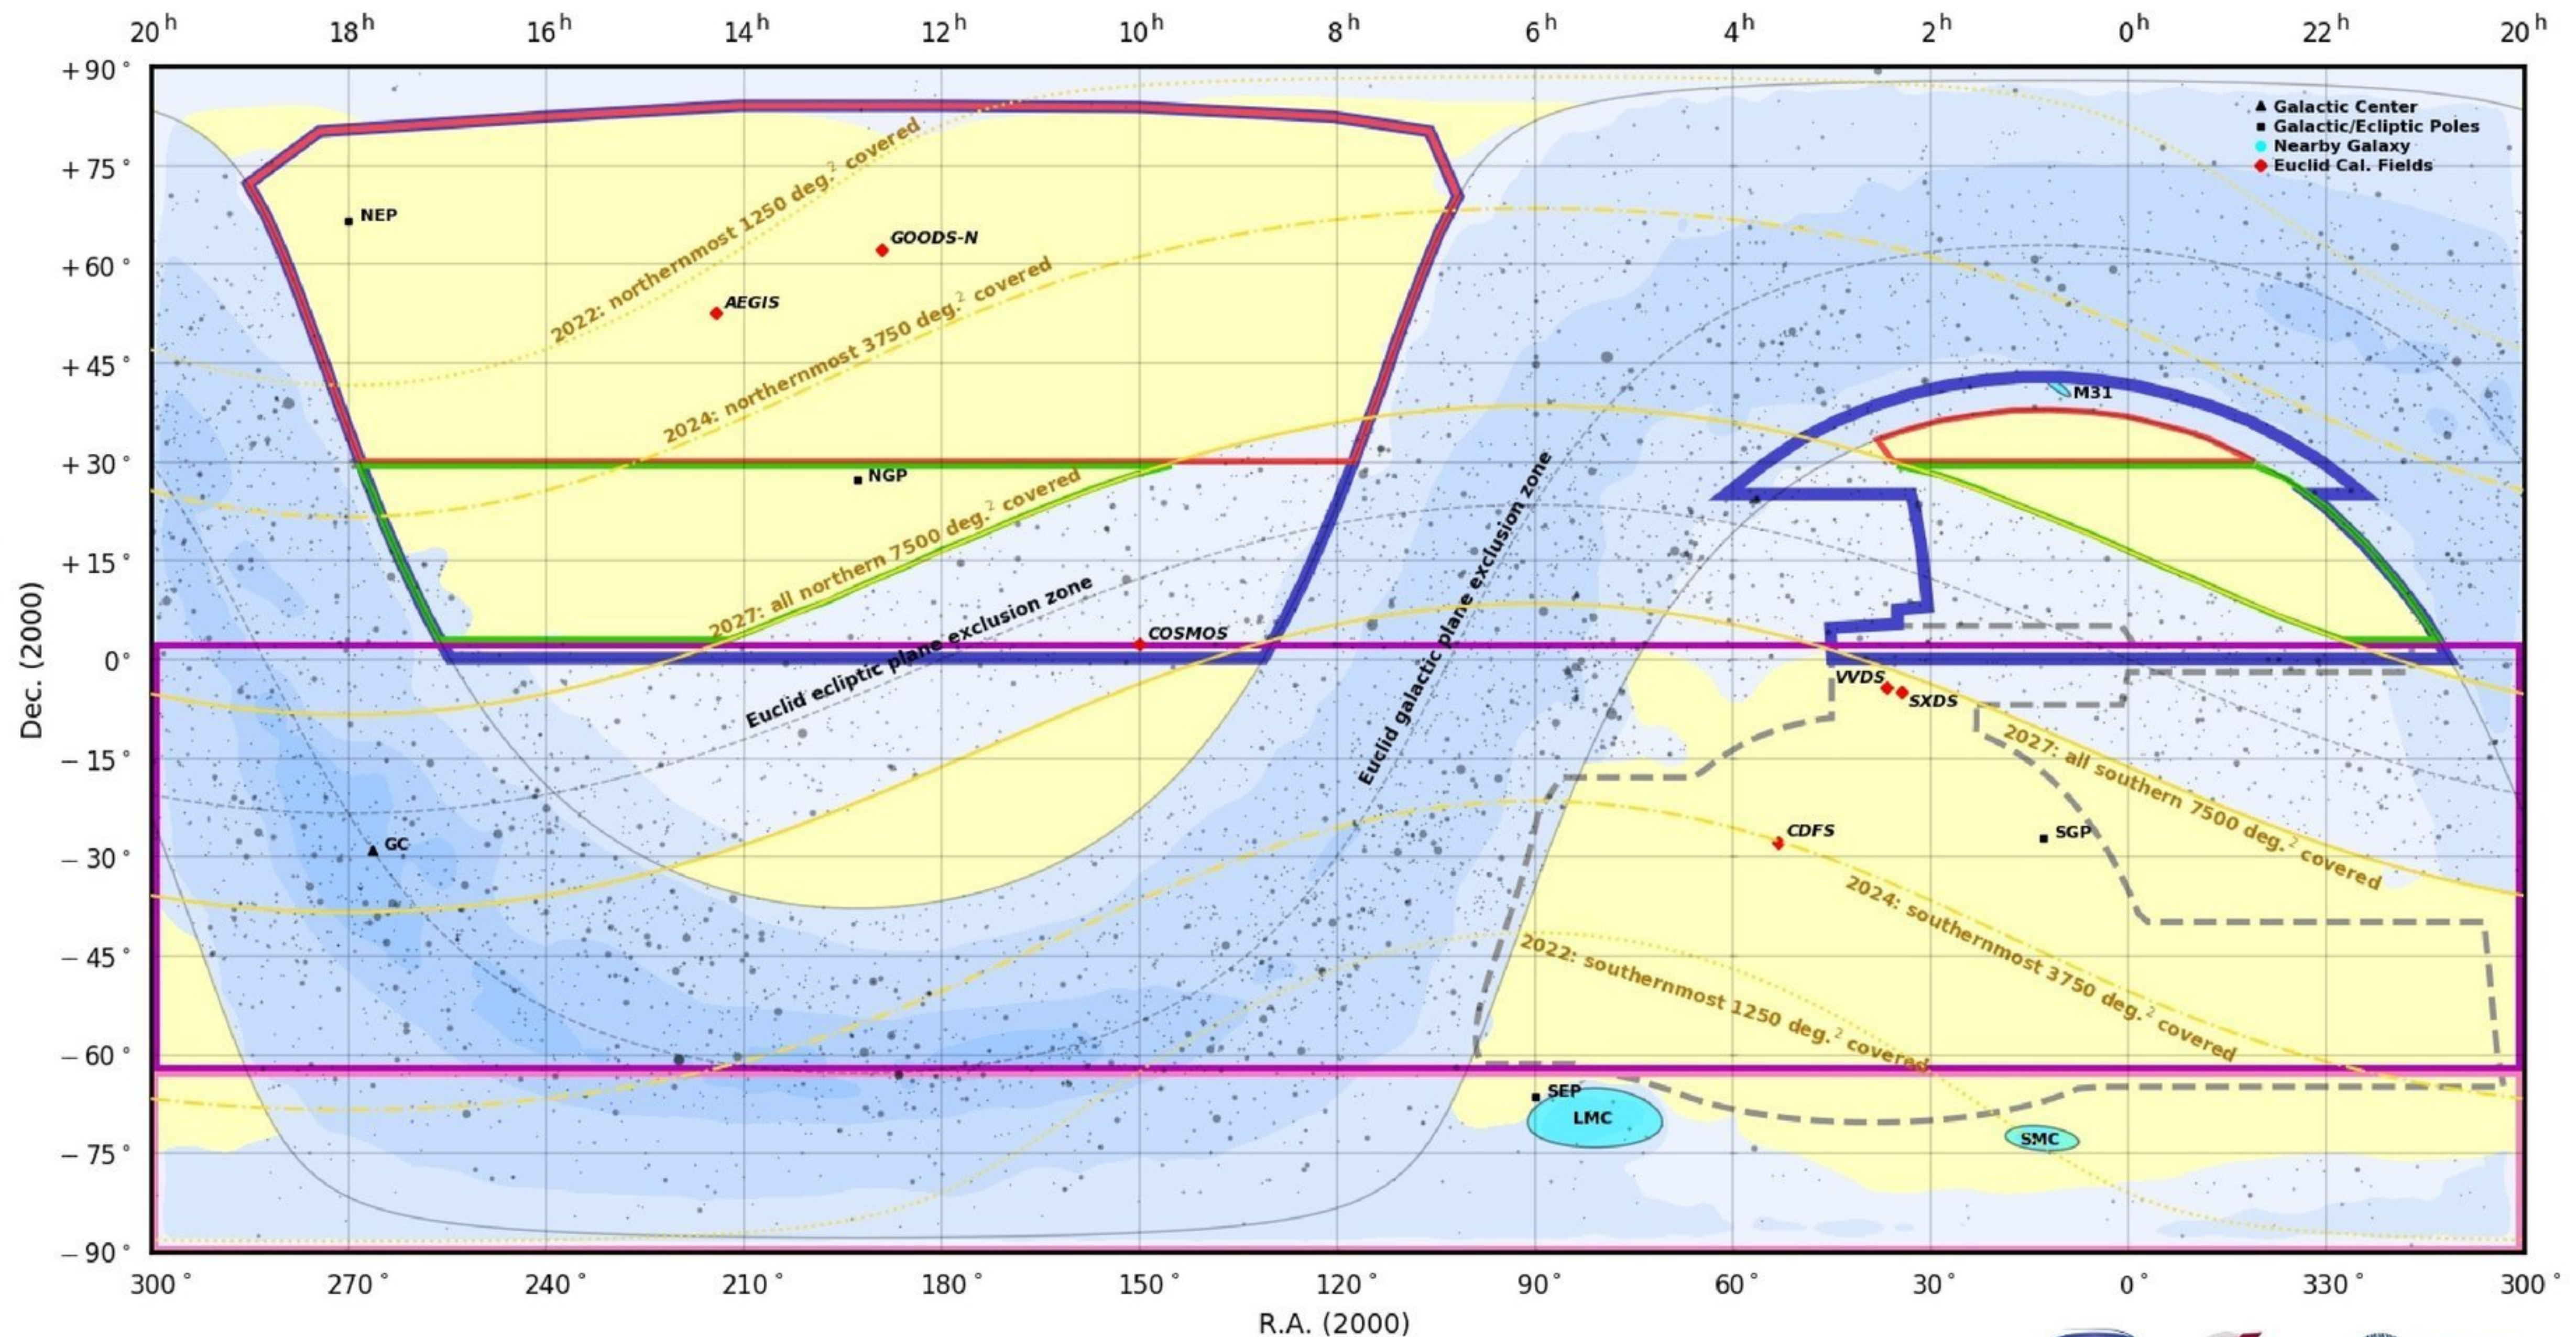

Present and upcoming wide-field imagers relevant to Euclid

Etendue ↑

Facility	Year	Aper.	FOV	IQ	CCD class	Type	Hemisphere
LSST	2022	6.6m	9.6 sq.deg.	0.8"	Deep depletion	Surveyor	South
Subaru	2013	8.2m	1.8 sq.deg.	0.6"	Fully depleted	Observatory	North
Blanco	2013	4.0m	3.0 sq.deg.	1.0"	Fully depleted	Observatory	South
JST	2020	2.5m	4.8 sq.deg.	0.7"	Deep depletion	Surveyor	North
PS1+PS2	2018	2x1.5m	7.0 sq.deg.	1.0"	Fully depleted	Surveyor	North
CFHT	2003	3.6m	1.0 sq.deg.	0.6"	EPI	Observatory	North

UNIONS CFIS/Pan-STARRS and the Euclid sky

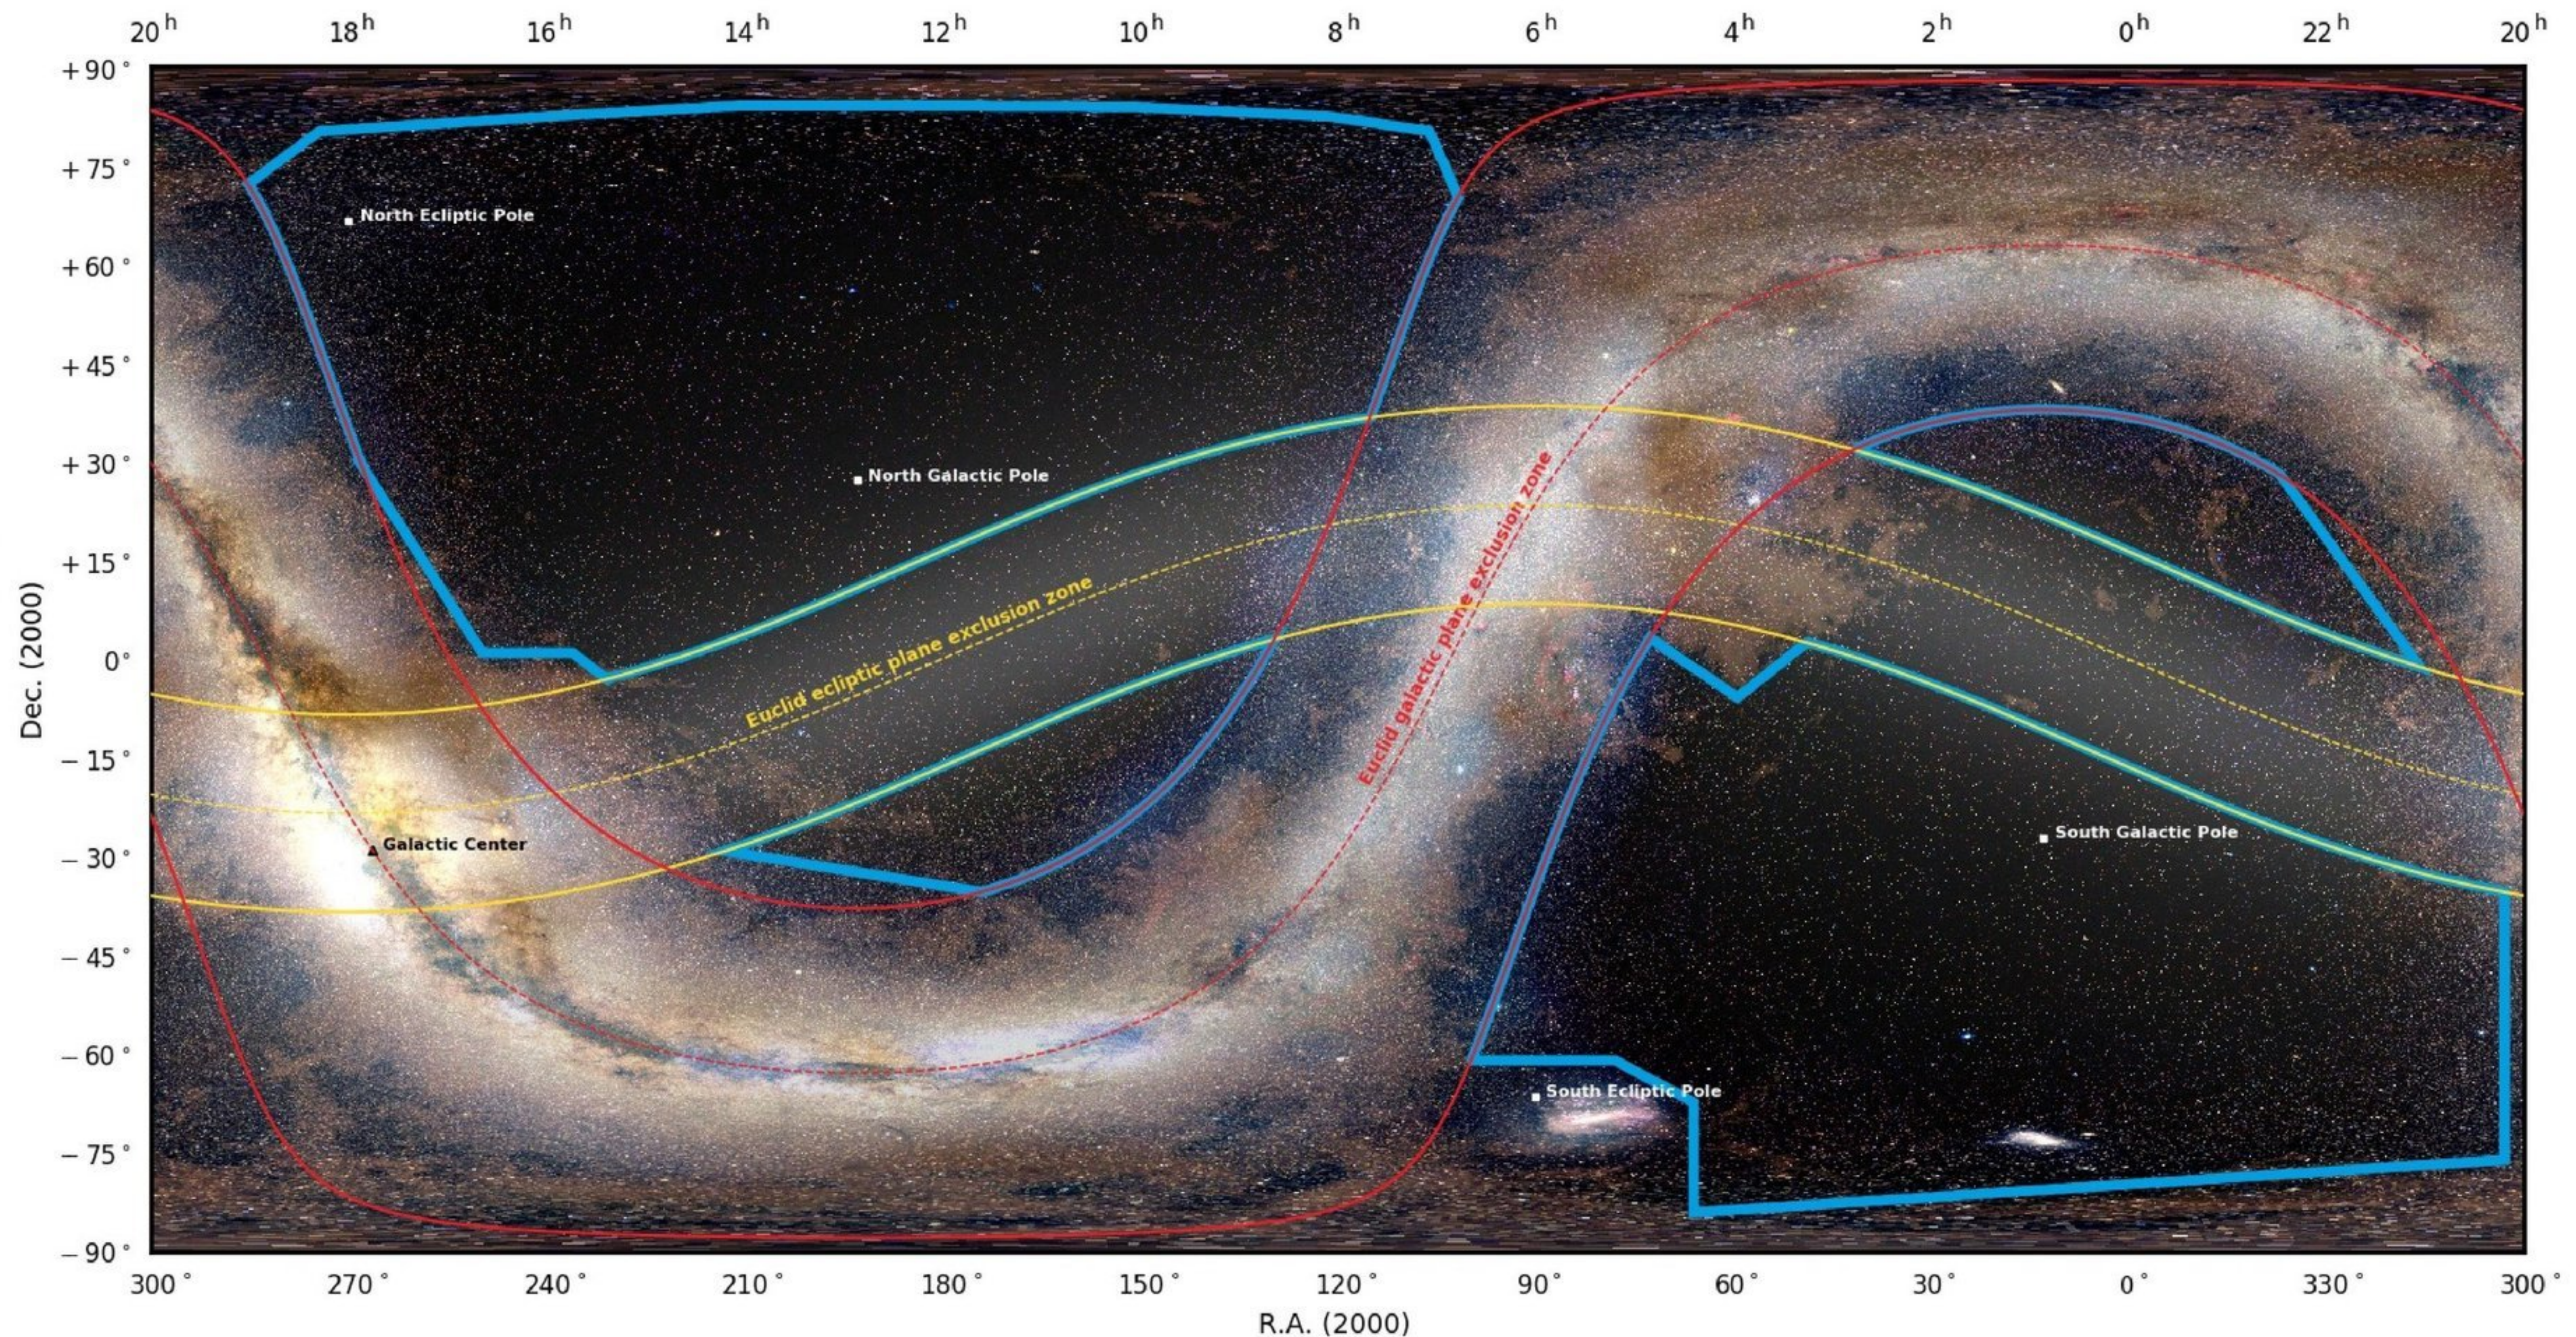

Expected ground-based coverage of the Euclid Wide Survey DR2/DR3 (2026/2029) (origin/bands/overlap)

- Euclid Wide Survey : 15,000 deg.² [with E(B-V)<0.08]
 - Euclid exclusion zone : 26,000 deg.² [galactic+ecliptic planes]
 - LSST main survey, ugriz : 7000 deg.²
 - LSST south extension, ugriz : 1000 deg.²
 - LSST north extension, griz : 3000 deg.²
 - DES-griz : 4500 deg.²
 - CFIS-u : 7300 deg.²
 - CFIS-r/JEDIS-g/Pan-STARRS-iz : 4800 deg.²
- ⇒ Ecliptic isolines track the space survey started at the ecliptic poles

LSST has the potential to cover 66% of the Euclid sky, but UNIONS owns the North

The whole sky as perceived by Euclid at Lagrangian#2

The Euclid Wide Survey based on ecliptic&galactic latitude thresholds (2014) + Stellar density & Reddening (Gaia/Planck, 2019)

- ▭ Euclid Wide Survey : total area of 15,000 deg.² evenly split across the two hemispheres
- ▭ Ecliptic plane [zodiacal light background] : +/- 15 deg. ecliptic latitude exclusion zone
- ▭ Galactic plane [stellar contamination] : +/- 25 deg. galactic latitude exclusion zone

Background image: Euclid Consortium / A. Mellinger / Planck Collaboration

Outline of the Euclid Wide Survey (15,000 square degrees) versus the exclusion zones

Paving the way to MSE targeting

UNIONS CFIS/Pan-STARRS contributes to building a deep static view of the northern sky

Conclusions

CFHT is now the best wide-field imager it has ever been
CFIS exploits CFHT's best strengths
CFIS maximizes sky access for science
Critical mass reached after two years: science percolates
CFIS and Pan-STARRS have joined forces in UNIONS

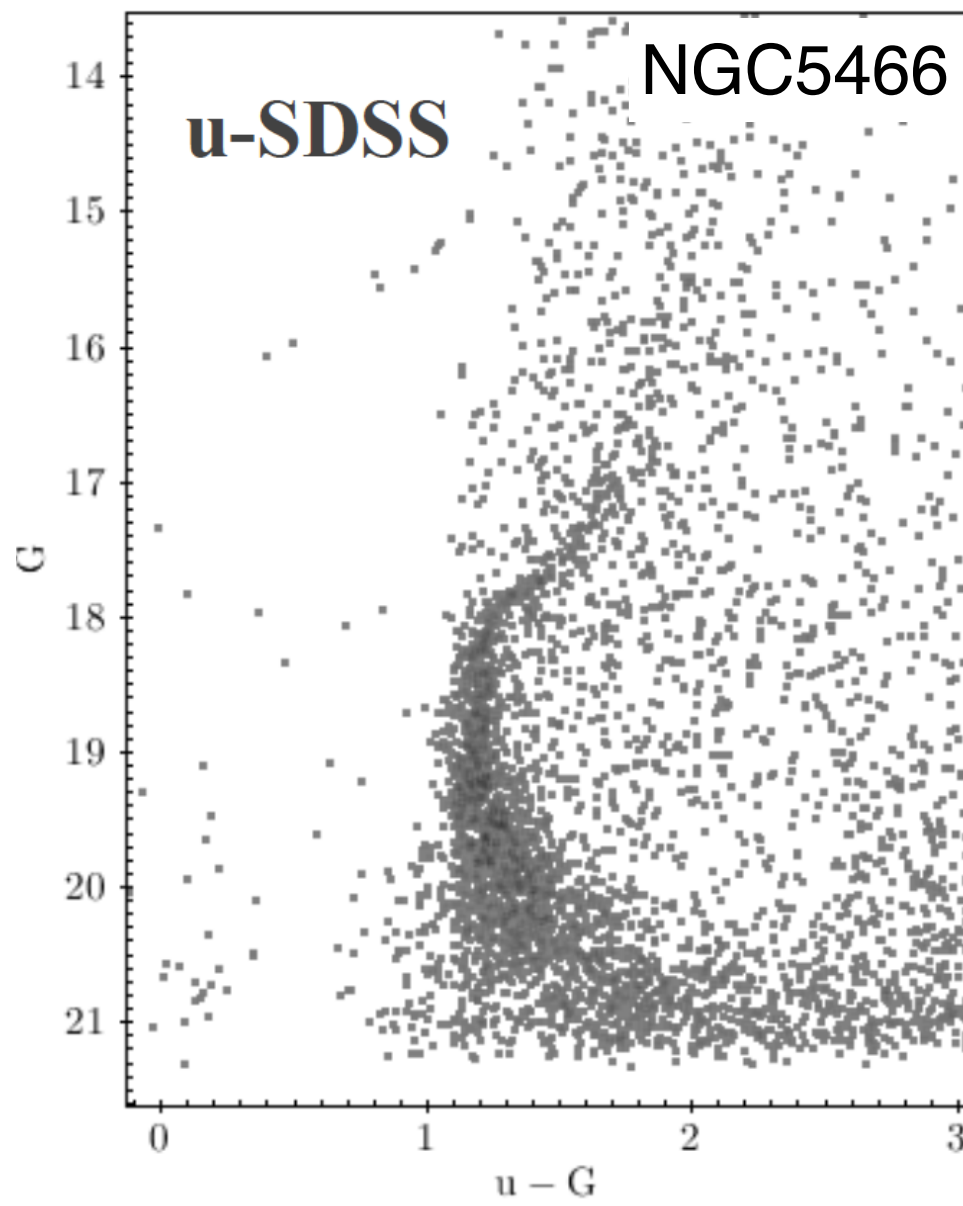

CFIS is progressing very slowly (weather) in the A-semester
At the current rate, CFIS will be completed at 60% by 2021
The CFIS Steering Group welcomes the LP completion policy
Realistic forecast of the 80% goal: CFIS needs 70 extra nights
Euclid will need 100% of the northernmost 5000 square deg.

Science highlights

- So far, CFIS has resulted in
 - 4 published peer reviewed publications
 - 1 in press peer reviewed publication (accepted just yesterday)
 - at least 2 peer reviewed publications in the late stages of preparation
- Team - lets get 10 papers submitted/in press/published by the end of the year...!
- In the remainder of this session:
 - ***The three dimensional structure of the outer stellar halo***
 - ***The hierarchical substructure of the Milky Way***
 - ***The tidal tails of the Milky Way***
 - ***The chemodynamics of the Galaxy, at the faint end of the Milky Way***
 - ***Mergers and the triggering of AGN***
 - ***A Universe of ultra-diffuse galaxies***
 - **Weak lensing (Mike Hudson)**
 - **Strong lensing (Raphael Gavazzi)**
 - **The star formation history of the Milky Way from white dwarfs (Nick Fantin)**

UNIONS

UNIONS

The three dimensional structure of the outer stellar halo

- Use Blue Horizontal Branch stars:
 - Hot stars $7400 < T_{\text{eff}} < 9300$
 - Relatively accurate standard candle ($\sim 10\%$ distance uncertainties)
- Easily traced to large radius (see previous work by (Yanny et al. 2000; Sirko et al. 2004; Deason et al. 2011, and others)).
- Major source of contamination is blue stragglers

The three dimensional structure of the outer stellar halo

Courtesy of Else Starkenburg (AIP)

- Comparison of BHB and BS stellar spectra show that the greatest discrimination between the two is in u-band (Balmer jump) and z band (Paschen lines)
- Use PCA technique involving CFIS u and PS1 griz

The three dimensional structure of the outer stellar halo

- Fit to full three dimensional distribution of BHB stars, accounting for CFIS footprint, photometric completeness, residual contaminations.
- Used power law, broken power-law models, with constant and variable flattening
- Formally, a (constant) oblate halo is preferred ($q \sim 0.8$), with a broken power-law profile (4.24 ± 0.08 with 40kpc). Profile is shallower (3.21 ± 0.07) after this radius

The three dimensional structure of the outer stellar halo

- Fit to full three dimensional distribution of BHB stars, accounting for CFIS footprint, photometric completeness, residual contaminations.
- Used power law, broken power-law models, with constant and variable flattening
- Formally, a (constant) oblate halo is preferred ($q \sim 0.8$), with a broken power-law profile (4.24 ± 0.08 with 40kpc). Profile is shallower (3.21 ± 0.07) after this radius

The hierarchical substructure of the Milky Way

- Using the BHB dataset to quantify the hierarchical structure of the Milky Way halo using the OPTICS algorithm (see McConnachie et al. 2018 for application to PAndAS data)
- Recover all known substructures in our footprint, as well as new structures and possible new streams surrounding some globular clusters

The hierarchical substructure of the Milky Way

- Using the BHB dataset to quantify the hierarchical structure of the Milky Way halo using the OPTICS algorithm (see McConnachie et al. 2018 for application to PAndAS data)
- Recover all known substructures in our footprint, as well as new structures and possible new streams surrounding some globular clusters

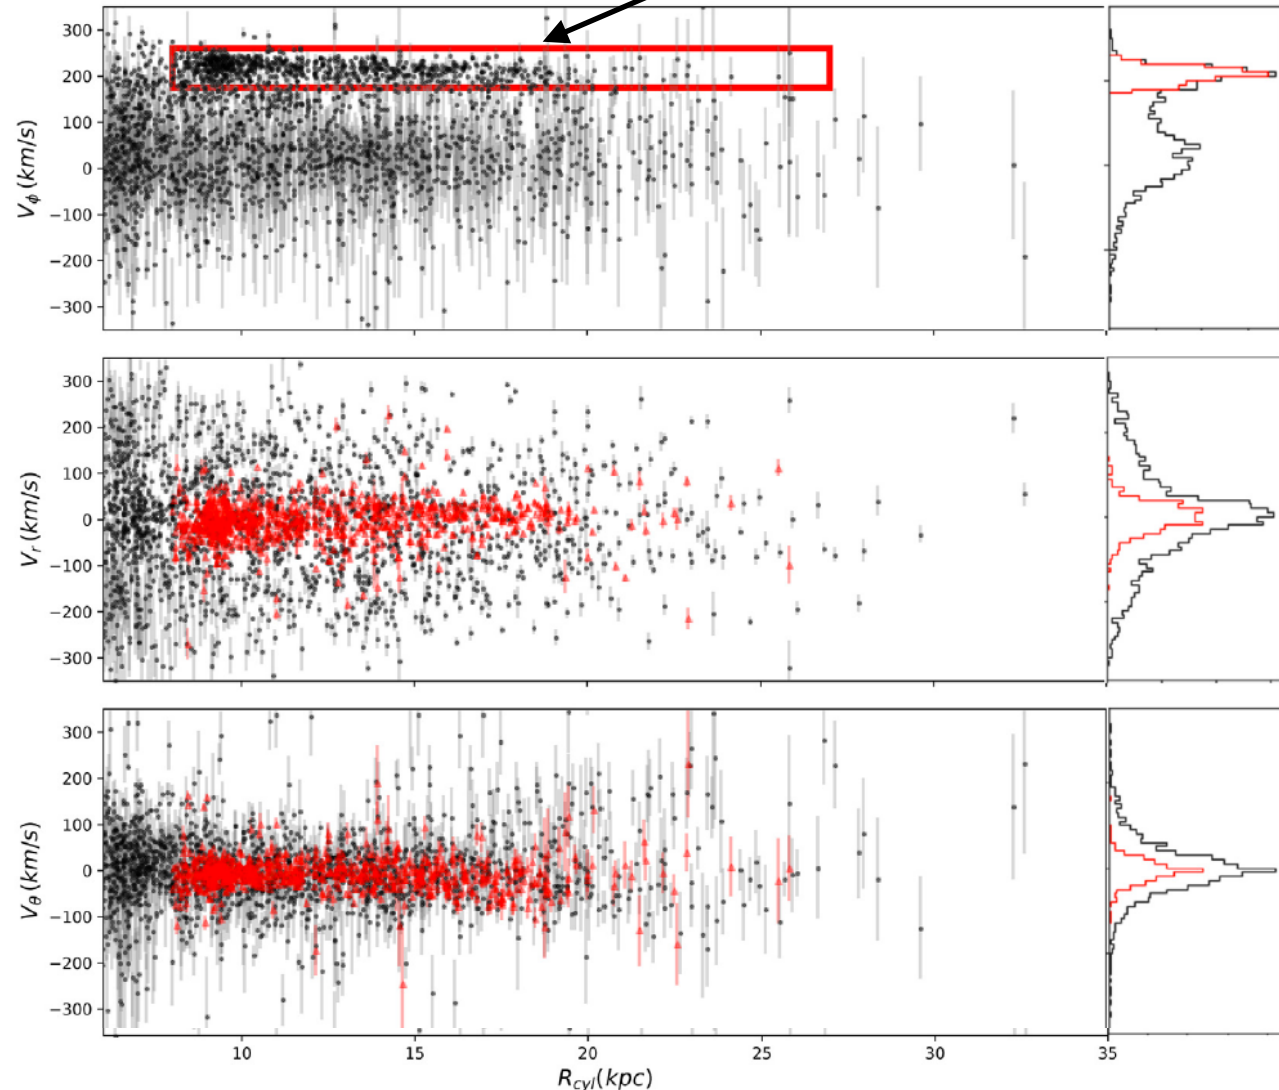

The tidal tails of the Milky Way

- Blue stragglers are much brighter than main sequence stars and reasonably numerous in denser stellar populations
- Ideal tracers of the outer disk!
- Cross-match the CFIS blue straggler population with Segue radial velocities and Gaia proper motions
- Note: Gaia parallaxes to these objects are less accurate than our photometric estimates
- (Based on empirical calibration by Deason et al. 2011 and confirmed on CFIS GCs)

Disc BS population?

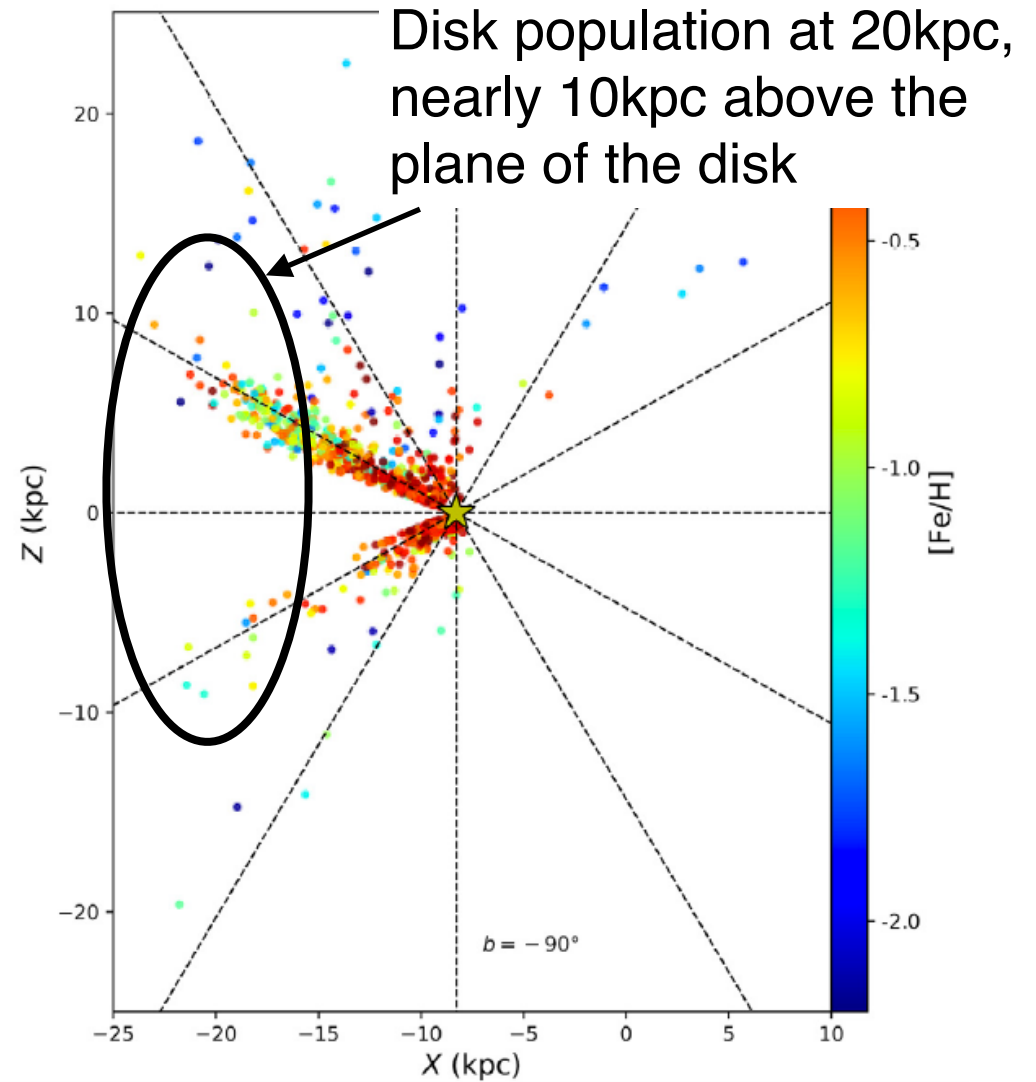

The tidal tails of the Milky Way

The tidal tails of the Milky Way

The tidal tails of the Milky Way

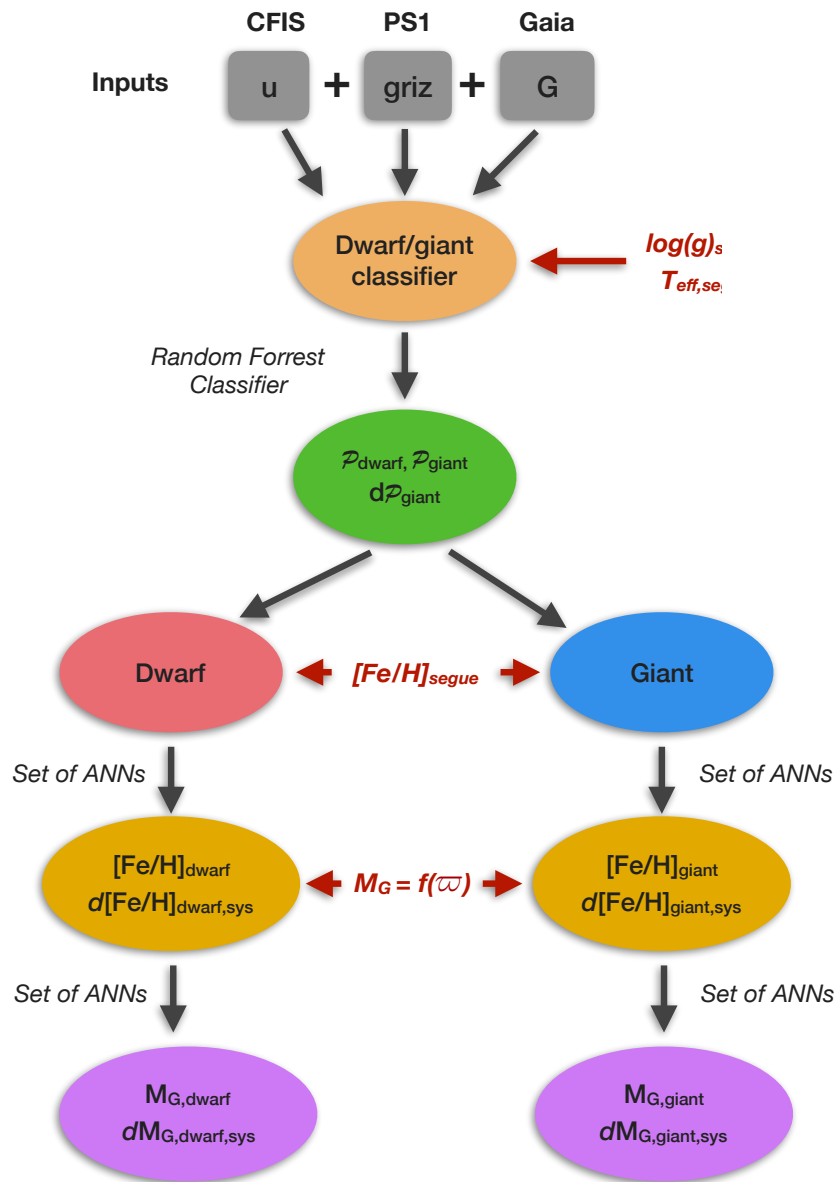

The tidal tails of the Milky Way

- Comparison with Laporte et al. 2018, simulating the interaction of Sgr with the disk of the MW
- Sgr dSph can create the flare, with stars at a vertical elevation of $z \sim 8.5$ kpc at $R = 25$ kpc

The chemodynamics of the Galaxy, at the faint end of the Milky Way

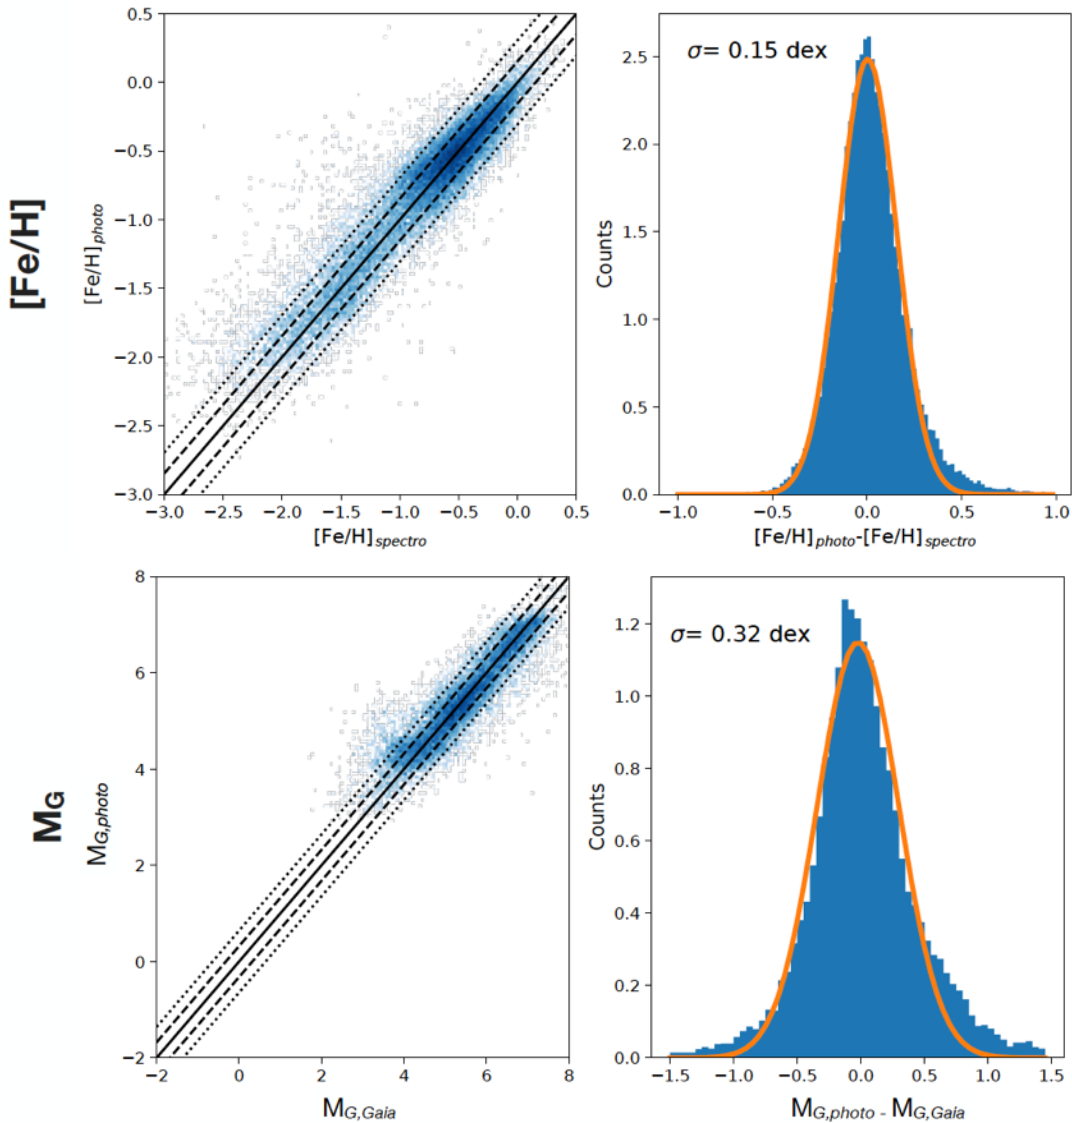

- Extending the ideas of Juric et al. and the principles of separating BHB from BS to the next level...
- Idea is to get the distance (via absolute magnitude) and metallicity for all dwarfs and giants in a photometric dataset, without knowing whether they are dwarfs or giants to begin with...
- Use PS1 and CFIS photometry
- Train to SDSS segue spectra for dwarfs/giants + $[Fe/H]$
- Use Gaia parallaxes for absolute magnitude
